

Erosion Control Plan Procedures

1. Highway Design will maintain an *Erosion Control Strategies* Sheet and an *Erosion Control Legend* for use as part of all Erosion Control Plan Submissions.
2. Design (Highway and/or Bridge) will develop erosion control base plans showing:
 - a. Existing condition plan with existing contours,
 - b. Proposed condition plan with proposed contours, and
 - c. Any traffic control phasing plans with contours necessary to show the various phases during construction that may have erosion control issues or require phased erosion control measures.
3. Design (Highway and/or Bridge) will coordinate a meeting between the Designer, Bureau of Environment, and Bureau of Construction to review the plans developed in paragraph 2 above, review construction phasing, and discuss the erosion control measures and strategies needed during construction of the project.
4. Bureau of Environment staff will finalize the erosion control measures and strategies, mark the appropriate strategies and measures on the plans and return the marked up plans to the Designer for drafting.
5. Once the strategies and measures have been drafted on the plans, the Designer will submit the wetlands permit application, including the Erosion Control Plan, to the Bureau of Environment for processing.
