\section*{Intersection Summary}

Area Type: Other
Cycle Length: 90
Actuated Cycle Length: 85.6
Natural Cycle: 90
Control Type: Actuated-Uncoordinated
Maximum v/c Ratio: 0.94
Intersection Signal Delay: 47.9
Intersection LOS: D
Intersection Capacity Utilization 76.4\% ICU Level of Service D
Analysis Period (min) 15
\# 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.

Splits and Phases: 7: Birch St/Crystal Ave \& NH 102 (E Broadway)

\subsection*{1.0 INTRODUCTION}

The Towns of Derry and Londonderry and the New Hampshire Department of Transportation (NHDOT), in cooperation with the Federal Highway Administration (FHWA), are preparing a Supplemental Draft Environmental Impact Statement (SDEIS) for the I-93 Exit 4A Project (Project). The Proposed Project consists of a new diamond interchange on I-93 in the Town of Londonderry, approximately 1 mile north of Exit 4 . The new diamond interchange would provide access to the east side of I-93. A 1-mile connector roadway would be built on new alignment from the interchange to Folsom Road, near the intersection of North High Street and Madden Road, in the Town of Derry. Folsom Road, and subsequently Tsienneto Road, would be upgraded, and the intersections would be improved. In total, the Proposed Project corridor from I-93 to the intersection of Tsienneto Road and NH Route 102/Chester Road would be 3.2 miles. The purpose of the Project is to reduce congestion and improve safety along NH 102, from I-93 east through downtown Derry and to promote economic vitality in the Derry/Londonderry area.

As part of the SDEIS, the Southern New Hampshire Planning Commission's (SNHPC's) regional travel demand model will be used to assess how the Project and alternatives may affect travel patterns in the 2040 design year. The travel demand model requires information on locallevel population and employment patterns to forecast the number of trip origin and end points in the future. In addition to estimating the number of trips, type of trips, and destination of trips, the travel demand model includes a representation of the roadway network (including highway capacity and speed). The travel demand model assigns trips to specific routes, which forms the basis for the total traffic volumes forecasted for each roadway. Separate model runs are required to represent the 2040 roadway network without the Project (e.g., the 2040 No Build) and with the Project completed (2040 Build). The travel demand model output of volumes for each roadway link in the network on a 24 -hour basis will be further processed as part of a detailed traffic impact analysis for the peak hours. The traffic impact analysis will be documented in the SDEIS traffic and transportation technical report and will in turn inform several other SDEIS technical analyses, including air quality and noise.
The purpose of this report is to document the basis for the local level population and employment inputs used in the travel demand modeling for the 2040 No Build and Build conditions. Given that the purpose of the Project includes encouraging economic development in Londonderry and Derry, a critical objective for the SDEIS is to estimate the quantity and location of potential future development potentially caused by the Project and to account for that growth in the travel demand modeling. As a result of including potential induced growth impacts in the travel demand model for the 2040 Build condition, the SDEIS will ensure consistency between the traffic analysis and the other land use-related portions of the SDEIS, including indirect and cumulative impacts. The overall land use forecasting process used is consistent with the recommendations of FHWA's Interim Guidance on the Application of Travel and Land Use Forecasting in NEPA (FHWA, 2010). Specifically, the forecasting effort included reviewing the suitability of existing forecasts; collaborating with land use/socioeconomic forecast experts, local planners, and the development community; and documenting the basis for assumptions.

\subsection*{1.1 Regulatory Framework}

The Council on Environmental Quality (CEQ) regulates implementation the National Environmental Policy Act (NEPA) and defines three types of effects: direct, indirect, and cumulative.
"Direct impacts are caused by the action and occur at the same time and place (40 Code of Federal Regulations [CFR] 1508.8)." Examples of direct impacts include displacements resulting from the acquisition of right-of-way or the fill placed in wetlands in order to construct a roadway improvement. The uncertainty associated with assessing direct impacts is very low relative to indirect and cumulative impacts.
"Indirect effects are caused by the action and are later in time or farther removed in distance, but are still reasonably foreseeable. Indirect effects may include growth-inducing effects and other effects related to induced changes in the pattern of land use, population density, or growth rate, and related effects on air and water and other natural systems, including ecosystems (40 CFR 1508.8)."

The National Cooperative Highway Research Program Report 403: Estimating the Indirect Effects of Proposed Transportation Projects identifies three types of indirect effects:
- Encroachment-Alteration Effects - alteration of the behavior and functioning of the affected environment caused by project encroachment (physical, chemical, or biological) on the environment.
- Induced Growth Effects - changes in the intensity of the use to which land is put that are caused by the action/project. These changes would not occur if the action/project does not occur. For transportation projects, induced growth is attributed to changes in accessibility caused by the project.
- Induced Growth Related Effects - alteration of the behavior and functioning of the affected environment attributable to induced growth.
"Cumulative impact is the impact on the environment, which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions, regardless of what agency or person undertakes such other actions. Cumulative impacts can result from individually minor but collectively significant actions taking place over a period of time (40 CFR 1508.7)." According to FHWA's Interim Guidance: Questions and Answers Regarding the Consideration of Indirect and Cumulative Impacts in the NEPA Process, cumulative impacts include the total of all impacts to a particular resource that have occurred, are occurring, and will likely occur as a result of any action or influence, including the direct and reasonably foreseeable indirect impacts of a proposed project (FHWA, 2003).

\subsection*{1.1.1 FHWA Interim Guidance on Travel and Land Use Forecasting}

In 2010, FHWA issued Interim Guidance on the Application of Travel and Land Use Forecasting in NEPA. Among other items, the guidance identifies considerations for improving how project-level forecasting is applied in the context of the process for meeting the requirements of NEPA and related project development. The interim guidance outlines the following key procedural and process considerations for land use and travel forecasting for NEPA:

Access project conditions and scope the forecasting needs of the study: It is crucial to scope and forecasting effort to meet the project analysis, decision-maker and stakeholder needs in the study area. For this reason, it is useful to begin the forecasting process by understanding the requirements of the study and anticipating the decision-maker and stakeholder interests with respect to forecasting.
Review the suitability of modeling methods, tools, and underlying data: It is important that the study team review the suitability of available modeling methods and the underlying data, including consideration of the currency and quality of the model data and methods, and that they analyze the data and methods' ability to adequately examine alternatives.
Conduct scoping and collaborate on methodologies: Scoping is a collaborative process involving the lead agencies, resource and regulatory agencies, and the public and is typically how a NEPA study begins. It is critical for the study team to document the broad agreements reached during scoping on the assumptions to be used for the land use and travel forecasting.
Objective application of forecasting in alternatives analysis: The requirement for the alternatives analysis to be an objective evaluation makes it essential for the study team to apply forecasting data and methods objectively without any bias towards a particular alternative. Important considerations include understanding uncertainty in assumptions and forecasts and how induced demand and land development effects are taken into account.
Project management considerations: NEPA studies are often complex undertakings and may be accompanied by various special considerations that warrant extra attention, such as the potential for re-do analysis loops and ensuring documentation consistency.

Forecasting for noise and air emissions analyses: Land use and travel demand forecasting models are used to provide inputs to noise and air quality assessments. It is important that assumptions that are made in general forecasting applications as part of the NEPA study are consistent with those used in the noise and air quality analyses.
Documentation and archiving: It is important for NEPA documentation to include enough technical detail to explain complex information in an understandable manner, and to describe how analytical methods were chosen, what assumptions were made, and who made those choices. (FHWA, 2010)

\subsection*{1.2 Relationship to Other Technical Reports}

Within the overall regulatory framework discussed in section 1.1, the focus of this report is the portion of indirect effects related to land use change/induced growth, as well as cumulative impacts on population and employment levels. The potential indirect environmental_impacts of the land use changes discussed in this report (such as additional habitat loss or additional stormwater runoff for example) will be documented separately in the SDEIS Indirect Effects Technical Report. The SDEIS and Indirect Effects Technical Report will also address encroachment-alteration type effects, such as habitat fragmentation. Similarly, cumulative
impacts on specific environmental resources will be thoroughly documented through a separate Cumulative Impacts Technical Report and in the SDEIS. However, the subsequent further indirect and cumulative impact analyses will utilize the population and employment levels and growth patterns identified in this report as a key input.
The travel demand modeling and traffic impact analyses will utilize the socioeconomic data results of this study as an input, but the details of these analyses will be documented separately in the Traffic and Transportation Technical Report.

\subsection*{2.0 METHODOLOGY}

The methodology used to develop the 2040 No Build and Build conditions land use forecasts included obtaining existing population and employment forecasts and interviewing local land use planners, socioeconomic data experts, and representatives of the development community.

\subsection*{2.1.1 Study Area}

The study area for the Build and No Build conditions is the "economic study area" described in the 2007 Draft EIS (DEIS), as shown in Figure 1. This study area encompasses 143 square miles within the two Towns of Derry and Londonderry, as well as Auburn, Chester, and Sandown. The five-town study area was determined by considering the likely geographic extent of potential direct, indirect, and cumulative effects related to land use and development-Derry and Londonderry would be directly affected, and Auburn, Chester, and Sandown may experience indirect effects due to improved access and travel time to I-93. The limits of the economic study area were agreed upon in consultation with state and federal agency staff at a meeting held on August 25, 2005. Given that there are no major changes in the basic alignment of the alternatives under consideration since the 2007 DEIS, the previously agreed on study area remains reasonable for this SDEIS.

\subsection*{2.1.2 Analysis Timeframe}

The temporal scope of analysis for the land use scenarios is based on past development trends and a future-planning horizon for which information on reasonably foreseeable future development is available. The Towns of Derry and Londonderry experienced rapid growth beginning in the 1960s and 1980s, respectively, based on available and affordable housing and favorable schools. Londonderry adopted a growth management ordinance (a subset of its zoning ordinance) in 1988 and readopted it in 1998. The ordinance was allowed to expire in 2015. Derry adopted a growth management ordinance (also a subset of its zoning ordinance) in 1999, which is still active. As a result, the past time horizon for consideration of development trends is 1990, the point at which the rapid growth began to be controlled (see section 3.1 - Past Population and Employment Trends). The future time horizon is 2040, which is the design year for the Project as well as a time horizon that encompasses the long-range comprehensive plans and long-range transportation plans for the study area. The 2040 future analysis year is also the analysis year that will be used for the transportation and air quality/noise impact analyses for the Project. The baseline or existing conditions model year for the transportation analyses for the Project is 2015, consequently 2015 land use and socioeconomic data is also reviewed in this report.

Figure 1. Study area

\subsection*{2.2 Data Reviewed}

Existing population and employment forecasts, comprehensive plans, and available development data were reviewed, including the following:
- U.S. Census Bureau 1990, 2000, and 2010 Decennial Census data (U.S. Census Bureau, 1990, 2000, and 2010)
- New Hampshire Employment Security (NHES) Economic and Labor Market Information Bureau employment data from 2004 and 2014 (NHES, 2015)
- New Hampshire Office of Energy and Planning (OEP) County and Municipal Populations Projections 2010-2040 (OEP, 2016a, 2016b)
- SNHPC's Moving Southern New Hampshire Forward: 2015-2035 Regional Comprehensive Plan (SNHPC, 2014) and letter to the Director of Derry Planning Department regarding population and dwelling unit projections (SNHPC, 2012a)
- SNHPC Population and Household Projections 2010-2050 (SNHPC, 2012b), and updated 2015-2040 Household Projections based on OEP Population Projections (SNHPC, 2016a)
- SNHPC Employment Projections for 2010-2050 based on New Hampshire Employment Security and NHDOT data (SNHPC, 2012c), SNHPC Updated Employment Estimates for 2015 (SNHPC, 2016b), and SNHPC Updated Employment Projections for 2020-2040 (SNHPC, 2016c)
- Rockingham Planning Commission (RPC) 2015 Regional Master Plan (RPC, 2015)
- Woodmont Commons Planned Unit Development (PUD) Application Materials (Pillsbury Realty Development, 2013)
- Master Plans of Derry and Londonderry (Town of Derry, 2010; Town of Londonderry, 2013)
- Master Plans of Chester, Auburn, and Sandown (Chester Planning Board, 2015; SNHPC, 2007; Sandown Master Plan Steering Committee et al., 2013)
- SNHPC Regional Comprehensive Plan (SNHPC, 2010)
- Regional Economic Development Center of Southern New Hampshire 2016 Comprehensive Economic Development Strategy (REDC, 2016)
- Environmental constraints on development, and local land use controls

\subsection*{2.3 Land Use Interviews}

The purpose of these structured interviews and outreach was to inform and support the analysis of reasonably foreseeable future growth, identify predicted future growth areas under the No Build and Build conditions, and estimate the indirect land use effects of the Project and alternatives.

In conjunction with the information gathered through the interviews, the data detailed in section 2.2 were reviewed to develop the forecasts associated with the 2040 No Build and Build conditions.

Interviews were conducted with the following planners and town staff on July 25-26, 2016:
- Town of Derry
- George Sioras, Planning Director
- Elizabeth Robidoux, Planning Assistant
- Mike Fowler, Public Works Director
- Town of Londonderry
- Colleen Mailloux, Town Planner
- John Vogl, GIS Manager/Comprehensive Planner
- SNHPC
- Julie Chen, Senior Transportation Planner
- Jack Munn, Chief Planner
- Adam Hlasny, Transportation Planner
- OEP
- Ken Gallager, Principal Planner

In addition, because the Woodmont Commons Project is planned adjacent to Exit 4A, Ari Pollack, the developer's representative, was interviewed. Finally, to gather information from municipalities identified in the economic/secondary impacts study area in the 2007 DEIS (i.e., Auburn, Chester, and Sandown), the following people were contacted via telephone.
- Bill Herman, Town Administrator, Auburn
- Andrew Hadik, Planning Coordinator, Chester; Dick Trask, Vice Chair, Chester Board of Selectmen
- Mark Traeger, Planning Board Member, Sandown

Materials, including maps and interview summaries, used to gather information via in-person and telephone interviews are included in Appendix A.

\subsection*{2.4 Uncertainty/Limitations}

As with any attempt to forecast future growth or development, there are limitations to the accuracy and certainty of the results of the land use forecasts. This uncertainty is impossible to quantify given that land use change occurs as result of numerous individual private land use decisions and other factors such as global and local economic conditions, housing trends and costs, availability of public water and sewer service, fuel prices and long-term technological changes. The 2040 No Build and Build conditions were developed through consideration of the latest available population and employment projections from state and regional agencies as well as input from planners and others knowledgeable of local conditions and trends. The forecasting process was consistent with the best practices recommended in FHWA's interim guidance on travel and land use forecasting. As a result, the land use forecasts provide a reasonable basis for comparing alternatives in the SDEIS and assessing potential indirect and cumulative impacts as required by CEQ's NEPA regulations. The land use forecasts also provide a logical construct and ensure that the SDEIS evaluation of transportation and land use impacts is consistent.

The No Build and Build land use forecasts developed as a result of this analysis should be considered as possible outcomes, and the addition and/or shift in type of development anticipated with the proposed Project should be considered as trends rather than absolute predictions that a certain number of residential units or gross square feet of commercial or industrial development will occur in any specific location. Ultimately, the development that occurs within the study area under the No Build and Build conditions will be based upon what the Towns will permit and what the market can support.

\subsection*{3.0 POPULATION, HOUSEHOLD, AND EMPLOYMENT PROJECTIONS}

The purpose of this section is to provide an overview of the existing population, household, and employment estimates and projections available for the study area.

\subsection*{3.1 Past Population, Household, and Employment Trends}

In mid to late 1990s, the towns in the study area implemented growth management strategies to control the substantial population growth and residential development. As Table 1 shows, between 1990 and 2000, the towns experienced average annual population increases between 1.37 percent (Auburn) and 3.49 percent (Chester), with an average annual increase of 1.64 percent across the study area. Between 2000 and 2010, the rate of population growth slowed in the study area for various reasons, including growth management ordinances and the economic downturn in 2007-2008. Chester and Sandown still experienced substantial population growth, increasing by an average annual rate of 2.32 percent and 1.53 percent, respectively. Auburn and Londonderry experienced a much lower rate of population growth, with annual average increases of 0.53 percent and 0.38 percent. During the same 2000 to 2010 timeframe, Derry's population decreased by an annual average rate of 0.27 percent.
Household data for 1990, 2000, and 2010 reveal that Chester and Sandown had the highest average annual household growth rates between 1990 and 2000 as well as between 2000 and 2010. Between 1990 and 2000, the average annual growth rates in Chester and Sandown were 3.48 percent and 2.65 percent, respectively. Between 2000 and 2010, the average annual growth rates in Chester and Sandown were 2.37 percent and 2.03 percent, respectively. The smallest household growth occurred in Derry with an average annual household growth rate of 1.36 percent between 1990 and 2000 and 0.17 percent between 2000 and 2010. Table 1 presents available household data.

Employment information in the form of number of jobs in each jurisdiction was not available for 1990 or 2000. SNHPC's 2010 employment data were calculated from NHES employer database and are presented in Table 2 along with NHES data provided in the community profiles of each jurisdiction (SNHPC, 2012c; NHES, 2015). Sandown is included in the RPC area, and its employment in 2010 as recorded in the RPC 2015 Master Plan is 399 (RPC, 2015). Overall, the data shows very limited growth in employment in the study area since 2004, with some jurisdictions showing declines. The largest growth in jobs occurred in Auburn (550 jobs added between 2004 and 2014).

\subsection*{3.2 New Hampshire Office of Energy and Planning}

OEP provides population projections for the state, counties, and municipalities. The latest projections were generated in 2016 (Table 3) (OEP, 2016a). OEP data show a slight decline in population in Derry between 2015 and 2025 and that Chester, Sandown, and Auburn are projected to be the fastest growing communities in terms of annual average growth rates ( 0.65 percent, 0.59 percent, and 0.52 percent, respectively). These 2016 projections reflect OEP's 2015 population estimates and the change in migration of populations within the state. According to the interview with OEP, the previous 2013 vital statistics/trends have not changed, but migration to southern New Hampshire is greater than anticipated at the time of the previous 2013 OEP projections, while migration to the northern and western portions of the state is less than anticipated.
The 2016 projections are based on the same methods used to generate the population projections outlined in the 2013 report (OEP, 2013) (i.e., cohort projections, Internal Revenue Service data, and migration rates). OEP worked with the regional planning commissions and conducted a meeting with them on June 20, 2016, to reach consensus on the migration rates to be used in the population projections. The group agreed to use 2000-2005 migration rates, reflecting a moderate growth outlook that is more positive than the outlook from the late 2000s, but not as robust as that of the 1990s. For Rockingham County, the 2000-2005 migration rate was \(2.9 \%\), compared to a \(0 \%\) migration rate between 1990-1995 and a \(6.3 \%\) migration rate between 19952000.

To allocate county-level population projections to towns, OEP reviewed each town's share of the total population and how that share has changed between 2000, 2010, and 2015. OEP assumed that the current trend in each town would continue: faster growing towns would experience more rapid growth than the county average, and slower growing towns would experience less growth.

The population decline between 2035 and 2040 is based on the aging population of the state. For example, Derry experienced a population loss of approximately 1,000 people between the 2000 and 2010 census; however, the population losses in the younger cohorts were greater.
Although OEP does not typically consider individual projects in its projections, the widening of I-93 was included based on the direct connection between the population and employment centers of Boston and Manchester. Appendix C of the SEIS for the I-93 widening project provides more detailed information regarding the OEP's inclusion of the build alternative for the I-93 widening project (8-lanes from Boston to Manchester) in its population projections.
Projects such as the I-93 Exit 4A Project that are not expected to have a large regional effect are not considered in OEP's projection process. As a result, during the interview, OEP agreed that its projections best represent a "No Build" condition for the Project because the OEP projections do not include growth that would potentially be caused by the I-93 Exit 4A Project. Large-scale planned developments, such as Woodmont Commons, are similarly not included in the OEP population projections.

\subsection*{3.3 Southern New Hampshire Planning Commission}

SNHPC develops whole-town and zonal (traffic analysis zone [TAZ]) population, household, and employment projections for the towns within its region for purposes of coordinated regional and local planning. Because SNHPC is also the official Metropolitan Planning Organization of
the region, its future projections are also used in the travel demand modeling for the regional long-range transportation plan.

\subsection*{3.3.1 Population and Household Projections}

SNHPC prepared population projections covering 2010 through 2050 in 2012. Therefore, the more recent OEP population projections were used by SNHPC at the municipal level for this report (2016a). Based on additional input from the Town of Chester (Appendix A), the population projections were updated for SNHPC's use. The revised numbers were based on the number of building permits issued since 2014 and the anticipated development proposals to subdivide large tracts of land. Table 4 presents the revised population projections for the Town of Chester. Additional details on the assumptions used in the revised projections for Chester are provided in Appendix A. SNHPC estimated the number of households at the town level based on the OEP population projections and the revised Town of Chester population projections (Tables 3 and 4). SNHPC's 2016 whole-town household projections for municipalities in the Project's study area are included in Table 5 (SNHPC, 2016a). To distribute population changes to TAZ, SNHPC dwelling unit projections adjusted based on 2015 dwelling unit estimates were used. Appendix B contains the 2015-2040 TAZ-level estimates for population and households and the memoranda outlining the technical methodology used by SNHPC to develop the model inputs.
Because Sandown is located in the RPC area and not the SNHPC area, information on Sandown households was derived from the RPC 2015 Master Plan (RPC, 2015). The number of Sandown households in 2010 is estimated to be 2,072. Future household projections for Sandown were only available for 2040 and were based on a scenario planning exercise by RPC to explore ways the region might grow. The Exit 4A Project was not considered by RPC in the scenario analysis. The "strong, dispersed growth" scenario is used in this report for Sandown's 2040 household projections because the report uses this scenario for employment projections (see section 3.3.3). The "strong, dispersed growth" scenario projects 2,914 households in Sandown in 2040. For comparison, the "slow growth" scenario projects 2,448 households and the "strong, concentrated growth" projects 2,325 households. Because household numbers between 2010 and 2040 were not available, Table 4 assumes straight-line growth between 2010 and 2040.

\subsection*{3.3.2 Employment Projections}

SNHPC also makes TAZ-level projections for employment based on quarterly employment averages from NHES that it compares to building permit data to estimate the number of jobs per square foot of non-residential development. The method used by SNHPC to generate updated TAZ-level projections is detailed in memoranda provided in Appendix B.
Table 6 includes updated 2015 projections based on state data that were adjusted to reflect the fact that SNHPC's 2010 employment information calculated directly from the employer database is slightly higher than the state data. Table 6 then uses the 5 -year percent increases from SNHPC's 2012 employment projections to recalculate projections for 2020 through 2040 using the updated 2015 projections. Appendix B includes a memorandum outlining the methodology used to project employment. The notable decline in Chester employment in 2015 is due to the closing of Chester College in 2012, while the rebound in employment in 2020 is projected based on the proposed opening of a Chinese School at the old Chester College (Jaschik, 2012; Williams, 2015). This dip in Chester employment values creates an elevated average annual
growth rate for the town for years 2015-2040 (2.21 percent); for comparison, the average annual growth rate from 2010-2040 was 0.62 percent.

Appendix C includes a sensitivity analysis of the 2040 SNHPC employment projections. The evaluation included the review of historical data from Woods \& Poole, a firm specializing in county-level economic projections. Employment data from Woods \& Poole measure the number of full- and part-time jobs by location of work (rather than location of residence) (U.S. Census Bureau, 2016a). In addition, population growth from the U.S. Census Bureau for 2003-2014, the time range for which town-level data were available, was reviewed (U.S. Census Bureau, 2016b; 2016c). Based on the evaluation, SNHPC's projection for average annual employment growth of 1.04 percent \(^{1}\) for the study area for 2015 through 2040 is similar to the Woods \& Poole's projection for employment growth in Rockingham County ( 1.07 percent). In addition, regression models were developed from the 2003-2014 Census data to investigate the relationships between growth rates in employment in the study area, population in the study area, employment in Rockingham County, and employment in New Hampshire. Two models were found to have the most predictive power: one relating study area employment to county-level employment, and a second relating it to county-level employment and study area population. Both regression models suggest study area employment growth rates that are comparable to the rate of growth implied by the SNHPC projection.
The employment sensitivity analysis shows that the SNHPC employment projection is consistent with the OEP population projection based on the historic relationship between population and employment in the region. Since the OEP population projection is considered to represent the future condition with the widening of I-93 to four-lanes in each direction (see section 3.2), the SNHPC employment projections is also considered to include the potential land use impacts of the I-93 widening. As noted previously, neither the OEP nor the SNHPC projections considered the Exit 4A project. Therefore, it is appropriate to use the OEP and SNHPC projections as the basis for the No Build condition for this project (since the widening of I-93 would occur with or without the completion of Exit 4A).
Like household data, information on Sandown employment was derived from the RPC 2015 Master Plan (RPC, 2015). Similar to household data, future employment projections for Sandown were only available for 2040 and were based on various possible future scenarios. The "strong, dispersed growth" scenario is used in this report because it is based directly on the NHES employment projections, which is similar to the methodology used for the employment projections developed by SNHPC. The "strong, dispersed growth" scenario projects 536 jobs in Sandown in 2040. For comparison, the "slow growth" scenario projects 390 jobs, and the "strong, concentrated growth" projects 446 jobs. Because employment numbers between 2010 and 2040 were not available, Table 6 assumes straight-line growth between 2010 and 2040.

\footnotetext{
\({ }^{1}\) The average annual growth rate for the study area is 1.04 percent regardless of whether Sandown is included.
}

Source: SNHPC (2012c, 2016b, 2016c), RPC (2015)
Notes: 2010 values were developed in 2012. 2015 projections were updated in 2016. 2020 through 2040 projections were then adjusted to reflect the 20125 -year projection increases based on the updated 2015 projections.
a The notable decline in Chester employment in 2015 is due to the closing of Chester College in 2012, while the rebound in employment in 2020 is projected based on the proposed opening of a Chinese School at the old Chester College (Jaschik, 2012; Williams, 2015). For reference, average annual growth rate in Chester between 2010 and 2040 is \(0.65 \%\) compared to the elevated \(2.24 \%\) shown in the table.
b Data from the RPC 2015 Regional Master Plan, with 2040 projections based on the "strong, dispersed growth" scenario. Employment data were not available for 2015-2035; therefore, this table includes straight-line growth between 2010 and 2040.

\subsection*{4.0 INTERVIEW SUMMARIES}

Interviews with local land use planners assisted with the development of the No Build and Build land use forecasts by identifying development trends in their respective towns and providing spatial and temporal information on planned and proposed developments. The following summaries of development trends are based on these interviews. More detailed summaries of these interviews are provided in Appendix A. The draft interview summaries were provided to all participants for review and comment, and the final interview summaries were approved by the participants.

\subsection*{4.1 Derry}

Since 1990, the rapid growth that Derry experienced from the 1960s through the 1980s has slowed. Derry's growth management ordinance was instituted in the mid-1990s along with changes in zoning to control density of residential development. In addition, the segmented ownership in the central business district and lack of large parcels of available land for development make substantial future growth impracticable. Currently, Derry is experiencing a trend of population decline related to an aging population and an outward migration of young adults as they seek employment and educational opportunities elsewhere.
The area immediately to the east of I-93, along Folsom Road north of North High Street, has been rezoned to encourage higher quality industrial and commercial development near the proposed Project. Additionally, residential areas south of Folsom Road and North High Street might be re-zoned to Industrial/Commercial zoning. The Derry planning staff indicated that the Project could have an effect on the timing and intensity of development/redevelopment in this small industrial-zoned area. Effects on commercial/industrial development in other areas of the town are not anticipated. The commercial zoning district along the southern end of Rockingham Road (Route 28) was revised in 2013, and some commercial development has occurred in that area. In addition, water and sewer services are being expanded along Rockingham Road to continue to encourage commercial development along that corridor.
Although no large parcels are suitable for large-scale developments, a 13-unit market-rate apartment building is planned near the central business district. An area along South Main Street/Rockingham Road is zoned for commercial development, and the town is extending water and sewer service to allow the area to develop at a higher density.
The limits of water and sewer service, the lack of large parcels, and the topography in the eastern portion of Derry serve to limit development. Lot size requirements and conserved land are also factors constraining any major single-family home developments in Derry. Because of the large number of development constraints, Derry planning staff suggested that the Project would be unlikely to induce additional residential development in Derry. However, the Project would encourage areas recently rezoned as industrial and commercial to develop by providing direct access to I-93.

\subsection*{4.2 Londonderry}

Since 2000, the rapid growth experienced in the 1980s and 1990s has slowed, and the current development trends are based on access to undeveloped or underdeveloped land and the presence or absence of municipal services (water/sewer), which affects the density of development. For
example, the industrial development on Pettengill Road is driven by undeveloped land with access to Raymond Wieczorek Drive (Manchester Airport Access Road). The Project would not affect this industrial development in northwest Londonderry. While a few parcels are available in west Londonderry, the proposed Project would not likely affect their future development because the Project would provide access only to the east of I-93.
On the east side of I-93, the Project would affect the timing and type of growth in Londonderry - the interchange and connector road would provide access and opportunity for commercial, institutional, and higher density residential development.
Woodmont Commons is a planned mixed-use urban village in the Town of Londonderry. The developer, Pillsbury Realty Development, LLC, owns approximately 630 acres bordering the east and west sides of I-93. Based on the PUD Master Plan (Pillsbury Realty Development, 2013), Woodmont Commons is divided into several phases, and development will occur over a 20-year period. The Town of Londonderry issued a conditional approval for the Phase I design plans in November 2016.
The Woodmont Commons development density with and without the Project is presented in the PUD Master Plan (Pillsbury Realty Development, 2013), and town planning staff indicated that the "without Exit 4A" scenario presented in the approved 2013 PUD Master Plan was based on design review meetings that included town staff, project engineers/planners, and the town's review consultant. Thus, the "with" and "without" Exit 4A scenarios (i.e., with Project and without Project scenarios) presented in the PUD Master Plan should not be construed as projections of growth, but rather should provide an upper cap on the maximum amount of development that could occur. This explains why less commercial development is allowed on the west side of I-93 without the Project than with it, even though the Project would provide no westerly access.
Without the Project, the Woodmont Commons development on the east side of I-93 would likely be a residential development model (up to 330 units as allowed by the PUD). The Londonderry planning staff agreed that the 400,000 gross square feet (gsf) of office development potentially allowed according to the PUD east of I-93 without the Project would likely not occur given the amount of traffic mitigation that would be required. Instead, a more realistic development scenario without the Project would be the aforementioned residential development with a small number of commercial businesses serving the needs of the 330 residential units (such as a convenience store or pharmacy).

With the Project, the current programming for the east side, which is also preferred by the Town of Londonderry, is for commercial land use accessed via Exit 4A. The developer expects a mixed-use build-out on the east side of I-93 to the level indicated by the caps in 2013 PUD Master Plan by 2040. In other words, the PUD caps represent a reasonable "Build" Scenario for the Project. No development would be expected to start until after the completion of the Project (currently expected by 2022). No potential development east of I-93 has been pre-sold or preleased (see Woodmont Commons Land Use Interview Summary, Appendix A).

With regard to development associated with Build Alternatives A, B, C, D, and F (from the 2007 DEIS), planners stated that growth in Londonderry under Alternatives C and D would be more in line with a No Build Alternative (or without the Project) because these alternatives would not provide access to the parcels that Woodmont Commons plans to develop for commercial and/or
institutional use. Given the easterly only access of the Project, development of the interchange would likely have little effect on the job growth or attraction of industries west of I-93.

\subsection*{4.3 Auburn, Chester, and Sandown}

\subsection*{4.3.1 Auburn}

Auburn is largely a bedroom community of about 16,000 acres with limited businesses. About a quarter of its area ( 4,200 acres) is the watershed for Massabesic Lake, which is the water supply for the City of Manchester. This limits the area available for development.
The primary drivers of growth are location and, more recently, the change in high school from Manchester to Pinkerton Academy. Auburn is located near Exits 1 and 2 of NH Route 101, which provides convenient access to I-93. Auburn's development has been different from most of the surrounding communities because it did not experience a decrease in development associated with the 2007-2008 recession. Auburn has issued approximately 35 new home building permits per year, and that did not change after 2007-2008. The Town Administrator stated that these new home permits are typically for custom homes on larger lots, and this trend of type and rate of residential development is expected to continue.

The Town Administrator indicated that the proposed Project is not likely to affect development and population growth in Auburn. Travel time may improve if some of the traffic on I-93 is pulled off the interstate by the Project, but this effect would likely be minor. Auburn residents would not be likely to use Exit 4A to travel from I-93 to Auburn because NH Route 101 already provides convenient access to the northern portion of the town, and the southern portion is closer to the existing Exit 5 than to Exit 4A.

\subsection*{4.3.2 Chester}

Chester is a rural community east of Derry. Access to I-93 is primarily through the Town of Derry. Chester is currently experiencing significant growth pressure in the form of a recent resurgence (spring 2016) of single-family residential development. Development activity has recently restarted on many of the subdivisions that have been dormant or partially complete since the 2007-2008 recession. Chester currently has approved or pending permits to develop about 300 lots, which are anticipated to be developed in the next 5 to 7 years (2022-2024) (Appendix A). In addition, the Town has two 30-lot and three 5-lot subdivisions that will be approved in the near future. One of the 30 -lot subdivisions is a Phase I - there will likely be an additional 90 lots in that 550-acre subdivision. The Chester Master Plan 2015 also recognizes this trend for residential growth in Chester. The plan notes that SNHPC projects that approximately 96 dwelling units would be constructed every 5 years through 2050 based on the town's historic growth rate and past building permit trends (Chester Planning Board, 2015). This long-term projection equates to an average of about 19 new home permits per year.
The primary drivers for additional residential development in Chester are good schools and the desire for rural living. Because the resurgence of residential/subdivision development is recent, it will likely be a year or two before Chester experiences a significant increase in elementary school enrollment. It is too early to determine whether a commensurate increase in school-age population or a shift in demographics of the population would occur; however, an increase is expected because most of the new homebuyers in Chester have one or more children.

Given Chester's access to I-93 through Derry, the planning coordinator indicated it was likely that the Project would induce additional residential development in Chester because of improved access to I-93.

Although the Project would enable additional growth in Chester, the town has a growth management provision in its zoning ordinance that would go into effect if pressure on school, fire, and police services outstrips the town's ability to keep pace with development. An open space subdivision provision is in place to encourage subdivisions to be creatively designed in a way that reduces sprawl and protects natural resources and rural character.

\subsection*{4.3.3 Sandown}

Sandown is a rural community east of Derry, and highway access to the town is either by I-93 (via Route 102 through Derry) or by I-495 (via 121A through Plaistow). The primary driver for growth in Sandown is affordable housing-the bulk of housing in Sandown would be considered starter homes with regard to price and size. In addition, the Planning Board member interviewed indicated that transportation access to I-495 and an increase in telecommuting have contributed to population growth due to an increase in people seeking affordable housing. Sandown experienced a major influx of people during the 1990s until the recession in 2007-2008; however, Sandown is experiencing a resurgence of development similar to Chester. A 50-unit apartment building was recently approved, and two developments initially planned for residents ages 55 and older are now being developed for individuals of any age.

Although Sandown has had growth management ordinances in the past, these ordinances are no longer in place because of lawsuits by developers. Sandown is now focused on buying and conserving land to reduce the available developable land in the town. Sandown purchased 200 acres for conserved open space that had been approved for 154 dwellings for residents ages 55 and older, resulting in a reduction of housing potential in Sandown. The Planning Board is considering applying for another community technical assistance program grant to acquire and conserve more land. Most of the larger tracts have been developed, and Sandown has only a few 100 -acre tracts left that could be developed as larger subdivisions.
Sandown has numerous wetlands and rivers, and in addition to purchasing land for conservation purposes, the town has a vernal pool protection provision in its zoning ordinance that includes a 25 -foot buffer around vernal pools and a building setback requirement of 50 feet. In addition, the Planning Board has passed variable road width and stormwater regulations to reduce impervious surface and promote low impact development. The conservation measures are designed to improve the quality of natural resources and allow the town to reduce the amount of development and associated increase in school enrollment.

The Planning Board member stated during the interview that the widening of I-93 is having a substantial effect on growth in Sandown by reducing travel times on I-93, which makes Sandown more attractive for young homebuyers. The Planning Board member believes the proposed Project has the potential to induce additional residential development in Sandown by providing better access and reduced travel time to I-93.

\subsection*{5.0 DEVELOPMENT UNDER THE 2040 NO BUILD AND BUILD CONDITIONS}

The 2040 No Build condition is the reasonably foreseeable future development anticipated without construction of the proposed Project. The 2040 Build condition is the reasonably foreseeable future development anticipated if the proposed Project is built and includes both the growth that is attributable to the improved transportation access created by the Project, as well as growth that is independent of the Project. The difference between the No Build and Build conditions is the indirect land use-or incremental-impact of the Project.

Both the 2040 No Build and 2040 Build conditions were developed after analyzing a variety of data sources and based on interviews with planners in local jurisdictions to ensure a collaborative process for land use and travel forecasting assumptions. Forecasting assumptions were also developed for the alternatives, as discussed in section 5.2 of this document. The overall process was guided by FHWA's Interim Guidance on the Application of Travel and Land Use Forecasting in NEPA (FHWA, 2010).

\subsection*{5.12040 No Build Condition}

The 2040 No Build condition includes population, household, and employment information. As discussed, in sections 3.2 and 3.3, OEP and revised Chester population projections and the resulting SNHPC household projections account for the growth associated with the I-93 widening project. As noted in the memorandum in Appendix C, the employment growth rates projected by SNHPC are consistent with the historic relationship between population and employment growth in the region. In other words, because the SNHPC employment projections are consistent with the OEP population projections that include the I-93 widening effects, the SNHPC employment projections are also considered representative of the future condition with the widening of I-93 (even though specific projects were not considered in making the employment projections as documented in the correspondence with SNHPC). Each component is developed from the 2015 estimates or projections documented in sections 3.2 and 3.3; background growth, calculated as the difference in 2015 estimates and 2040 projections; and growth from known development projects. Each component (population, households, and employment) is discussed in more detail in the following sections.

\subsection*{5.1.1 Population, Household, and Employment Growth}

Average annual population growth is projected to be 0.29 percent throughout the study area between 2015 and 2040, with annual population growth as high as 0.99 percent in Chester and as low as 0.03 percent in Derry. Annual household growth is projected to be 0.31 percent throughout the study area, with the highest annual household growth in Chester and Sandown at 0.99 and 1.14 percent, respectively. The lowest household average annual growth is projected to be in Derry at 0.32 percent, similar to the lower population growth in this town.

Based on updated SNHPC 2015 employment estimates and SNHPC 2016 projection 5-year growth trends through 2040, employment is projected to grow at an average of 1.04 percent average annual growth in the study area. Although 2015-2040 average annual employment growth for Chester is the highest of the jurisdictions at 2.21 percent, this value is elevated because of decreased 2015 employment values (see Section 3.3.3 for an explanation of the decreased 2015 Chester employment values). Analyzing the average annual employment growth
in Chester between 2010 and 2040 reveals a 0.62 percent annual employment growth rate as noted in section 3.3.2. Therefore, Auburn has the highest consistent average annual employment growth at 1.63 percent. Table 7 provides an overview of the 2040 No Build population, household, and employment components.

Table 7. 2040 No Build population, households, and employment

Note: See notes for Tables 3, 4, and 5 for information about projections.
}

\subsection*{5.1.2 Known Development Proposals}

Reasonably foreseeable future development under the No Build condition includes known development proposals identified from land use planner interviews.
There are no large-scale planned developments in Derry-the extent of water and sewer service, the lack of large undeveloped parcels, and the topography in the eastern portion of Derry limit development. Lot size requirements and conserved land also constrain major single-family home developments in Derry. There is a 13-unit market-rate apartment building planned near the central business district. In addition, an area along South Main Street/Rockingham Road is zoned for commercial development, and the town is extending water and sewer service to allow the area to develop at a higher density. Both the 13-unit building and the infrastructure extension were judged to be accounted for in the background growth rate (e.g., the OEP population and SNHPC employment projections).
Londonderry has several known planned or proposed developments. The Woodmont Commons PUD is planned on the east and west sides of I-93 (see Figure 2 for the limits of the PUD). The Market Basket redevelopment area, shown in Figure 2, is owned by DeMoulas Super Markets, Inc. and is part of the Woodmont Commons Subarea WC-1GL, on the west side of I-93. The redevelopment area was approved by the Town of Londonderry in October 2015. The new Market Basket was constructed on the other side of the plaza from the original grocery store. The redevelopment approved in 2015 involved the demolition of about 74,000 gsf of commercial space and the addition of about \(42,000 \mathrm{gsf}\) of commercial development (Town of Londonderry, 2015). Construction is complete; as of May 2016, the \(42,000 \mathrm{gsf}\) were occupied by a state liquor store, a card store, TJ Maxx, and Marshall's Home Goods. In addition, there are four commercial pads available for development within the redevelopment area along John R. Michels Way, the roadway running through the Woodmont Commons development area connecting Garden Lane and Pillsbury Road. DeMoulas is currently looking for potential tenants and has received interest from multiple parties. The development of these parcels would occur with or without the Exit 4A Project. At this time, the types of tenants and buildings that would be constructed are unknown (see Appendix A, Woodmont Commons: Market Basket Redevelopment). Although the four pad sites have not been approved for development, it is possible that they could provide an additional 20,000 to 30,000 gsf of commercial development (see Appendix A: Londonderry Market Basket Redevelopment). As such, \(30,000 \mathrm{gsf}\) of potential additional commercial development has been included in the 2040 No Build condition.
In November 2016, the Town of Londonderry planning staff conditionally approved the Phase I plans for the initial Woodmont Commons development west of I-93, and Phase I is anticipated to be built by 2020. Phase I would include mixed use residential and commercial space, with approximately 60 percent retail space and 40 percent office space; five restaurants, including one restaurant/brewery; a hotel; a concert venue; and individual elderly living. Figure 2 shows the approximate location of Phase 1 of Woodmont Commons, and Table 8 shows a summary of uses planned for Phase I. Build Alternatives A though F are shown in Figure 2 for geographic reference.

Figure 2. Woodmont Commons

\hline
\end{tabular}

Source: Pillsbury Realty Development, LLC (2016)
Based on discussions with the Town of Londonderry and the developer, the remainder of the Woodmont Commons PUD area (east and west of I-93) is anticipated to be built out by 2040.
The Woodmont Commons PUD Master Plan includes maximum development caps that would be permitted by Town of Londonderry for the PUD (east and west of I-93) with the Exit 4A Project and without the Exit 4A Project. The maximum growth caps outlined in the Woodmont Commons PUD Master Plan were used in the development of the No Build and Build conditions to provide a conservative estimate of indirect impacts (i.e., using the upper bound allowable growth results in predicting greater environmental impacts). The actual development that occurs within the Woodmont Commons PUD by 2040 may be less than this maximum depending on economic conditions and regulatory approvals (see section 2.4 for a discussion of the uncertainty associated with future growth impacts).
The Woodmont Commons PUD allows more growth on the east side of I-93 with Exit 4A than without Exit 4A, and this difference in growth forms the basis for the estimated indirect land use effects of Exit 4A on the east side of I-93 (see section 5.2.1, Table 14). The greater growth allowed with Exit 4A in Woodmont East is consistent with the direct interstate access to the east that would be provided by Alternatives A and B, increasing accessibility to undeveloped land along the interstate.
The Woodmont Commons PUD also allows more growth on the west side of I-93 with Exit 4A compared to the No Build condition. From a transportation access perspective, this increase in growth on the west side was not immediately intuitive given that Alternatives A and B would provide a direct connection to the east only. However, the project team identified several ways in which the Exit 4A Project could support increased development on the west side of I-93:
- Exit 4A would provide indirect interstate access to Woodmont West via internal roadways within Woodmont East, which would link to Pillsbury Road/Ash St. Pillsbury Road/Ash St. is an east-west roadway that crosses over I-93 and through the Woodmont West PUD area.
- Exit 4A has the potential to reduce demand on Exit 4 by diverting a portion of drivers currently using Exit 4 to the new Exit 4A. As a result, the Town of Londonderry would allow more development on the west side of I-93 because the potential constraint posed by Exit 4 operations would be lessened. Additional
information on traffic impacts will be available when the traffic technical report is completed.
- The large-scale economic development anticipated on the east side of I-93 with Exit 4A could have synergistic economic impacts on the west side of I-93. For example, additional office space would result in a large population in the area during the day and increase the demand for retail/restaurants.

The PUD "No Exit 4A" growth caps for Woodmont Commons were the primary basis for the No Build condition because the PUD itself provides a regulatory framework that would prohibit higher levels of growth without the appropriate transportation network support Exit 4A would provide. The developer would still attempt to maximize their return on investment by developing both the east and west sides of I-93 within the limits imposed by the PUD. The No Build condition forecast used for this project differs from the PUD "No Exit 4A" development caps in one important respect-it was determined through the interviews that the build-out of 400,000 gsf of commercial development on the east side of I-93 as included in the "No Exit 4A" PUD caps was not likely without Exit 4A due to the level of traffic mitigation that would be required. This level of development would require direct interstate access as would be provided with Exit 4A. Therefore, a predominately residential development is anticipated on the east side of I-93 without Exit 4A (330 households as allowed by the PUD). A small amount of supporting commercial was also included ( \(20 \mathrm{sf} /\) household).

In addition to Woodmont Commons, substantial industrial development is projected along the new Pettengill Road in Londonderry, which opened in December 2015. The relocated and new road extends from its former terminus at Industrial Drive to the new Raymond Wieczorek Drive (Applied Economic Research, 2012). The new road provides easier access to the ManchesterBoston Regional Airport and the F. E. Everett Turnpike/South Manchester from Londonderry and opened up nearly 1,000 acres of prime, non-residential land for business users. Based on SNHPC projections, the Pettengill Road Industrial Area would support a total of 1,750 industrial jobs in TAZ 64 and TAZ 274 in Londonderry from 2010 through 2050 (SNHPC, 2016b; 2016c). Assuming linear job growth for that 40-year period, five-eighths of that job growth would coincide with the analysis years of this report (2015-2040). \({ }^{2}\) Therefore, this report assumes approximately 1,094 jobs would be added across this industrial area by 2040. These jobs would include at least a portion of the jobs associated with the proposed F.W. Webb distribution center, which is planned to include a 785,000 -square-foot facility along Webb Drive, an extension of Pettengill Road (Heritage Commission, 2016).
Figure 3 shows future known, large-scale developments in Londonderry, and Table 9 presents a summary of these developments, including Woodmont Commons and future reasonable foreseeable development along Pettengill Road. Build Alternatives A though F are shown in Figure 3 for geographic reference.

\footnotetext{
\({ }^{2}\) This report assumes that the first 5 years of Pettengill Road employment growth were incorporated into SNHPC 2015 updated employment projections. Overall Pettengill Road employment growth was added starting in 2010 because the estimate for Pettengill Road growth was designed to be added over the 2010-2050 time period.
}

Source: Pillsbury Realty Development (2013), SNHPC (2012a), Interviews with the Town of Londonderry and a Woodmont Commons representative (see Appendix A)
\({ }^{\text {a }}\) Phase I includes development shown in Table 8 (Pillsbury Realty Development, 2013). The Woodmont Commons Remainder is the remaining development that would be permitted without Exit 4A that could be built by 2040 .
b Job projections for Pettengill Road Industrial Area based on full projection of 1,750 jobs from 20102050 (SNHPC, 20116b; 2016c). This table assumes five-eighths ( 25 of 40 years or 2015-2040) of the projected jobs to match the timeframe of this report. It is assumed development along Pettengill Road would include the proposed approximately \(785,000 \mathrm{gsf}\) of development for the F.W. Webb distribution center.
c Based on the interview with the Woodmont Commons representative on August 7, 2016, it was agreed that developing the upper cap of \(400,000 \mathrm{gsf}\) of commercial on the east side of \(\mathrm{I}-93\) was unlikely without Exit 4A due to the traffic mitigation that would be required (see Appendix A). This new total assumes about 20 gsf of support commercial space per residential unit planned.

Figure 3. Large-scale developments in Londonderry

Population growth from known development projects, the last element used to calculate the 2040 No Build population, was calculated for residential units using average household size for the study area based on SNHPC population information. \({ }^{3}\) Average household size was calculated following SNHPC's methods and used the occupancy rate from the 2010 Census (U.S. Census Bureau, 2010) and the existing (2015) population and housing units. \({ }^{4}\) Based on a study area average household size of 2.73 persons and a total of 1,410 residential units under the No Build condition, the total 2040 No Build known development project population would be approximately 3,849 people. No adjustment to population was made to attempt to account for people moving to the study area for new employment opportunities, such as at Woodmont Commons. Given the dispersed nature of the local employment market, the employees in future industrial jobs, commercial development, or hotels would likely be spread throughout the region and would include people changing jobs, not simply migration.

Household growth from known development projects, also the last element used to calculate the 2040 No Build households, is based on the sum of residential units produced from the No Build known development projects in Table 9 multiplied by the occupancy rate. Because 2040 occupancy rates are unknown, the 2010 SNHPC weighted average occupancy rate of 95.4 percent was used to calculate households in 2040 (2016c). \({ }^{5}\) Based on the known development projects including 1,410 residential housing units and an occupancy rate of 95.4 percent, the total No Build condition known development project households would be approximately 1,345 . Because Woodmont Commons is the source of all of the known development project households, and Woodmont Commons is in Londonderry, all 1,345 known development project households are assigned to Londonderry in section 5.1.3.
Employment growth from known development projects is based on calculating the number of employees based on the size and type of known development project, unless the total number of jobs for a known development project was known as in the case of the Pettengill Road redevelopment. Using industry standard employee to gross square foot comparison factors by type of development, Table 10 calculates employees for each known development project given the retail assumptions noted in the "Conversion to Jobs" column (RKG Associates, 2016; MWCOG, n.d.). The remainder of the development associated with Woodmont Commons (postphase 1) creates the most employment of any project with approximately 1,864 jobs produced based on an assumed mix of one-half general retail, one-quarter restaurants, and one-quarter other services. In total, approximately 4,219 No Build condition jobs are anticipated from the known development projects.

\footnotetext{
\({ }^{3}\) Sandown is in the RPC boundary, and therefore is not included in the SNHPC data. However, none of the known development projects included residential units in Sandown, therefore it was reasonable not to include Sandown information in the population calculation.
\({ }^{4}\) Household size \(=(\) Population - special population) \(/(\) housing units*occupancy rate \()\). Special populations accounts for those living in dormitories, nursing homes, prisons, and drug treatment facilities - i.e., not standard housing units.
\({ }^{5}\) Average occupancy rate was weighted based on number of dwelling units within each jurisdiction's TAZs. Footnote \#2 regarding omission of Sandown information also applies to this calculation.
}

Note: See notes for Table 6 for information about projections.

\subsection*{5.22040 Build Condition}

The 2040 Build condition is developed by adding the population, households, and employment growth from development anticipated to be induced by the proposed Project to the 2040 No Build condition values. The induced development presented for the 2040 Build condition is based on Alternative A, which was identified as the preferred alternative in the 2007 DEIS. Alternatives A and B would induce the greatest amount of development relative to the other build alternatives. A comparison of Alternatives B, C, D, and F to the 2040 Build condition (Alternative A ) follows the presentation of the anticipated growth for Alternative A .

\subsection*{5.2.1 Alternative A}

This section first discusses the incremental impact of Alternative A (e.g., indirect land use effects), and then provides a summary of the total 2040 Build condition land use forecast.

\section*{Indirect Land Use Effects}

The additional reasonably foreseeable future development under Alternative A was identified through the land use planner interviews. Table 14 provides a summary of the incremental growth anticipated to be induced by Alternative A, which includes changes in the density and type of development anticipated for Woodmont Commons, as well as commercial and industrial growth in Derry induced by improved access to I-93.

\hline
\end{tabular}

Source: Pillsbury Realty Development (2013), Interviews with the Towns and a Woodmont Commons representative (see Appendix A).
a Based on the interview with the Woodmont Commons representative on August 7, 2016, it was agreed that developing the upper cap of 400,000 gsf of commercial uses on the East side of I-93 for Phase 1 was unlikely without Exit 4A due to the traffic mitigation that would be required (see Appendix A and footnotes to Table 8). This Build condition value total assumes the difference between the likely No Build Phase 1 commercial development (400,000 gsf -6,600 gsf) plus the remainder of the East side development that would be anticipated as a result of the access provided by Exit 4A (300,000 gsf).
b Because it is not possible to predict which type of jobs would result from Derry's industrial rezoning and redevelopment due to the flexible nature of the Industrial District IV zoning that allows retail, commercial, and industrial development, all jobs were assumed to be in the industrial category.

\section*{Town of Derry}

The Town of Derry has several parcels zoned as Industrial IV, which allows commercial and industrial uses, east of I-93 along Folsom Road, north of North High Street. Redevelopment of the parcels currently zoned as industrial would be encouraged by Alternative A, which provides access to I-93 via Folsom and Madden Roads. The parcels south of Madden and Folsom Roads and west of North High Street were rezoned as Industrial VI in 2004, and construction of the Corporate Park Industrial Park was completed in 2005. Presently, the Town of Derry is undertaking a study to determine whether to rezone several residential properties currently zoned as medium-high density residential to an industrial zoning category (Figure 4). Figure 4 shows these properties and their relationship to Alternative A.

With regard to the properties along Folsom Road north of North High Street, the Build condition includes an estimate of the possible redevelopment that could be induced by Alternative A. To determine the amount of induced development on these parcels, it was necessary to determine the amount of likely existing development or jobs and subtract that from the amount of possible future development or jobs. It was assumed that the industrially zoned properties south of Folsom and Madden Roads would not be redeveloped because the properties have been recently developed (2005). Therefore, only the properties north of Folsom and Madden Roads that are zoned as Industrial District IV were examined for redevelopment.
Of the 10 Industrial District IV properties north of Folsom and Madden Roads that could be developed to higher intensity as a result of Alternative A, only four have existing structures that appear to be places of work rather than residences. Based on Geographic Information System
(GIS) information from the Town of Derry, the footprints of the existing buildings total 43,478 square feet. Based on a windshield survey of the type of businesses, Table 15 outlines the approximate amount of square footage for each use. Using industry-standard employee to gross square foot comparison factors by type of development, Table 15 also provides an estimate of the number of existing employees at the Derry Industrial District IV parcels.

Table 15. Existing Derry Industrial District IV development type and estimated employees
\begin{tabular}{|l|c|c|c|}
\hline \multicolumn{1}{|c|}{ Development Type } & \begin{tabular}{c} 
Development \\
Size
\end{tabular} & Conversion to Jobs & Jobs \\
\hline Retail & \(8,328 \mathrm{gsf}\) & General Retail: 400 gsf/employee & 21 \\
\hline Office & \(18,322 \mathrm{gsf}\) & Industrial Office: \(300 \mathrm{gsf} / \mathrm{employee}\) & 61 \\
\hline Industrial/Manufacturing & \(27,191 \mathrm{gsf}\) & Industrial/Manufacturing: 800 gsf/employee & 34 \\
\hline \multicolumn{4}{|l|}{ Total } \\
\hline
\end{tabular}

Source: Town of Derry GIS, RKG Associates (2016); MWCOG (n.d.)
Note: The total amount of development (development size) is greater than the total building footprint size because several buildings appeared to have partial second floors.

Appendix G of the I-93 Widening (Salem to Manchester) Supplemental Environmental Impact Statement (SEIS) includes a memorandum providing revised local future employment estimates to account for the potential indirect land use effects of Exit 4A (NHDOT and FHWA, 2010). The analysis conducted for this memorandum is no longer relevant because the Woodmont PUD was not available at that time (among other changes over time).However, the memorandum included research on employment densities of select industrial properties in Londonderry and Derry that remains applicable and useful for this study. To estimate the potential industrial redevelopment potential of the Industrial District IV properties, the average industrial employment density from the research provided in Appendix G of the I-93 Widening SEIS is used in this report. Table 16 includes the employment densities of three industrial properties in Derry from Appendix G of the SEIS and their average employment density.

Table 16. Employment density of select industrial businesses in Derry
\begin{tabular}{|l|l|l|c|c|c|c|}
\hline & & & & & \(\begin{array}{c}\text { Employment } \\
\text { Density } \\
\text { Name }\end{array}\) & \multicolumn{1}{c|}{ Address }
\end{tabular} \(\left.\begin{array}{c}\text { Average } \\
\text { Employment } \\
\text { Density } \\
\text { (employees } \\
\text { per acre) }\end{array}\right]\)

Source: NHDOT and FHWA (2010)

The total area of Industrial District IV properties within the identified redevelopment area that are more than 1 acre (the minimum lot size required by zoning to develop a property in Industrial District IV) is 31.7 acres. \({ }^{6}\) Using the average industrial employment density in Table 16 and the amount of Industrial District IV acreage available, the estimated future employment capacity of the Industrial District IV properties is 380 jobs. Although it is not possible to know whether the market could support build out in this area by 2040, these jobs are estimated to be potentially attributable to the interstate access improvements provided to this area of Derry by Alternative A. Additionally, some of the parcels greater than 1 acre adjacent to and north of Folsom and Madden Roads would be transected by Alternative A, which may result in a lower estimated future employment capacity. Subtracting the total number of existing jobs on these industrial properties (see Table 15), the net approximate Build condition employment for these rezoned Industrial District IV properties is 264 jobs.

As previously mentioned, there is the potential for rezoning several residential properties currently zoned as medium-high density residential to an industrial zoning category (Figure 4). If these 10 residential properties were to be rezoned to Industrial Districts IV or VI, only as many as four of the properties could be redeveloped as industrial if properties were not combined because of the minimum lot area requirement in both zoning categories of 1 acre (Town of Derry, 2016). Assuming all four of these properties more than 1 acre were rezoned and redeveloped, a total of 6.8 acres, there would be about 82 jobs produced from the redevelopment based on the aforementioned acre-to-employee conversion factors.

\section*{Town of Londonderry}

The change in type and amount of development anticipated for Woodmont Commons is based on the modification of the development that would be permitted by the Town of Londonderry (e.g., the "With Exit 4A" scenario from the PUD Master Plan) (see section 4.2). It should be noted that the Woodmont Commons PUD Master Plan includes the maximum possible development that would be permitted by Town of Londonderry for the PUD (east and west of I-93) with the Exit 4A Project. As mentioned in sections 2.4 and 5.1.2, this maximum development has been used as a conservative measure to evaluate potential environmental impacts (i.e., resulting from the development of available land) and should not be construed as a prediction of economic benefit of the Proposed Project. The amount of development for Woodmont Commons was converted into 2040 Build condition population, households, and employment (jobs) using the same methodology discussed in section 5.1.2. Therefore, based on a study area average household size of 2.73 persons and a total of nine Build residential units, the total 2040 Build known development population would be approximately 25 people. Household growth was calculated by multiplying the residential units produced in Woodmont Commons by the 2010 SNHPC weighted average occupancy rate of 95.4 percent, resulting in about nine households.
Employment growth (jobs) from known development projects was calculated based on the size and type of known development project, using the industry standard employee to gross square foot comparison factors by type of development (RKG Associates, 2016; MWCOG, n.d.; U.S. Green Building Council, 2008). Given the assumptions noted in Table 17, approximately 4,335 Build condition jobs are anticipated as a result of the development induced by the Exit 4A Project. This "incremental growth" is added to the No Build condition total population,

\footnotetext{
\({ }^{6}\) Two parcels shared the same parcel number and therefore were considered as one.
}
households and employment to obtain the total Build condition socioeconomic inputs for the traffic modeling.

The industrial developments in the northwest portion of Londonderry would not be affected by the Project. Access to those parcels is provided by Pettengill Road and Raymond Wieczorek Drive (Manchester Airport Access Road).

\section*{Chester, Sandown, and Auburn}

As discussed in the interview summaries, Chester and Sandown are likely to experience additional residential development as a result of Alternative A due to the improved access provided by Exit 4A, which would enable commuters to bypass downtown Derry. Even considering the growth management strategies discussed in section 4.0, the local planners agreed that Alternative A could contribute to Chester and Sandown reaching their 2040 projected population earlier than would otherwise occur in the No Build condition. The potential range of impacts was considered by examining two scenarios:
- Moderate growth impact scenario- Chester and Sandown reach their 2040 population level 5 years early, in 2035. Between 2035 and 2040, the population of both towns continues to grow at the same rate as OEP's projection for 2035-2040.
- High growth impact scenario- Chester and Sandown reach their 2040 population level 10 years early in 2030. Between 2030 and 2040, the population of both towns continues to grow at the same average annual rate as OEP's projection for 2030-2040.

Table 18 presents a comparison of the No Build and both the moderate growth and high-growth impact scenario populations for Chester and Sandown. To present a conservative assessment of potential impacts, the high growth impact scenario was used for impact analysis and incorporated in the travel demand model. The high growth impact scenario yields an additional 1,117 people in Chester and 21 people in Sandown under the 2040 Build condition. Using the 2040 population and household information to determine average household size for each town in 2040, the additional people yield approximately 371 and 9 additional households in 2040 for Chester and Sandown, respectively.

Auburn is not likely to experience a change in growth and development associated with Alternative A because Auburn already has more direct access to I-93 via Exit 5 and NH 101. The local official interviewed as part of this study concurred with this conclusion (see Appendix A).

\section*{2040 Build Condition Land Use Forecast Summary}

Based on the information presented above, the 2040 Build population for the study area is estimated to be 83,654 , as outlined in Table 19, an increase of 1,163 people over the No Build condition. Tables 20 and 21 show the total households and employment (jobs), respectively, for the study area under the 2040 Build condition. The total number of 2040 Build households for the study area is estimated to be 34,190 , an increase of 389 households over the No Build condition (Table 20), and the 2040 Build employment for the study area is estimated to be 39,975 jobs, an increase of 4,681 jobs over the No Build condition (Table 21). The large increase in employment under the Build condition is primarily attributable to the additional build out of Woodmont Commons that Londonderry will permit with the completion of Exit 4A.

Figure 4. Location of potential redeveloped and rezoned properties in the Town of Derry

\subsection*{5.2.2 Alternative B}

Compared to Alternative A, Alternative B would be expected to result in similar commercial and industrial growth in Derry. Although the exact location of the connector road would be different from that proposed for Alternative A, Alternative B would provide access to the area zoned as Industrial IV and the area being considered for rezoning. The development associated with Woodmont Commons and Chester are anticipated to be similar under Alternatives A and B. As previously mentioned, the proposed Project is not expected to affect the industrial developments in the northwest portion of Londonderry and residential development in Auburn. Finally, the anticipated increased rate of residential development in Chester and Sandown would be similar under Alternatives A and B.

\subsection*{5.2.3 Alternative C}

The commercial and industrial development anticipated in Derry under Alternative A would not be realized under Alternative C because the rezoned parcels along Folsom Road north of North High Street would not have direct access to the interchange. As Figure 3 shows, the alignment of Alternative C would constrain additional commercial/industrial development due to lack of available land adjacent to the right-of-way. As the alignment approaches I-93, a transmission line and conservation areas limit the available land for development. Where the alignment follows Route 28, the adjacent land is largely built out with commercial and industrial uses. Although it is possible that some of the commercial and industrial parcels could be redeveloped, it is unlikely to result in a substantive net gain of commercial or industrial space because of the size of the individual parcels.

Londonderry planning staff and the Woodmont Commons representative indicated that Build Alternative C would limit access to the area available for development near I-93 to an extent that, if this alternative were selected, the Woodmont Commons area on the east side of I-93 would be developed as detailed under the No Build (e.g., primarily residential, 330 households). As previously mentioned, the proposed Project is not expected to affect the industrial developments in the northwest portion of Londonderry and residential development in Auburn. Finally, the anticipated increased rate of residential development in Chester and Sandown would be similar under Alternatives A and B given that the Alternative C interchange/roadway improvements would still provide a bypass of downtown Derry (although with a less direct route than Alternative A).

\subsection*{5.2.4 Alternative D}

Development under Alternative D would be the same as that anticipated under Alternative C because the interchange would be located in the same location as Alternative C. Roadway improvements would follow Tsienneto Road to connect with NH 102 (similar to Alternative A).

\subsection*{5.2.5 Alternative \(F\)}

Alternative F would involve an upgrade of NH Route 102 between Londonderry Road and the NH Route 28 Bypass. Development under Alternative F in the area of Woodmont Commons and the industrial area of Derry would be the same as that anticipated under the No Build condition. The indirect land use impacts on Chester and Sandown are not anticipated. Although the improvements on NH 102 would reduce congestion through downtown Derry, Alternative F does
not include improvements that would enable commuters to bypass downtown Derry, thereby encouraging growth in Chester or Sandown.

\subsection*{6.0 ALLOCATION OF GROWTH TO TRAFFIC ANALYSIS ZONES}

The purpose of this section is to document how the town-level and development-specific projections for the No Build and Build conditions discussed in prior sections were allocated to geographic unit required by the SNHPC traffic model, the TAZ. The Traffic Technical Report will discuss in detail how the population, household, employment projections from this Report will be used to develop traffic data.The anticipated population, household, and job growth associated with the known No Build developments was assigned to TAZs based on the percentage of the development land area in each TAZ. The detailed formulas for assigning population and households to TAZ are provided in a memorandum in Appendix D. Table 22 shows the 2040 No Build condition growth from known developments, and Table 23 shows the total 2040 No Build condition. Employment data are not available for publication due to confidentiality issues.

\end{tabular}

Notes: TAZs in this table are those that include population, household, and employment growth from known developments under the No Build condition or incremental growth associated with the Build condition (Alternative A). The whole-town TAZ tables for the entire study area are included in Appendix D. SNHPC background employment data by TAZ is confidential and not available for publication. \(\mathrm{Cl}=\) Confidential Information.
a Auburn is listed as NA because there are no known developments or induced growth anticipated; therefore, population, households, and employment were not allocated to TAZs.
The anticipated induced population and household growth for Sandown was not assigned to TAZs because Sandown is located in an external zone in the traffic demand model.

The 2040 Build condition incremental growth associated with Derry redevelopment, Woodmont Commons, and induced residential development was assigned to TAZs using the following approach. The anticipated job growth that could result from Derry redevelopment was assigned based on the location of the parcels currently zoned as Industrial IV within each TAZ that would have access to I-93 as a result of Alternative A. The anticipated job growth that could result from the potential Derry rezoning was assigned based on the location of the parcels currently zoned as medium high density residential within each TAZ that would have access to I-93 as a result of Alternative A. The anticipated population, household, and job growth associated with Woodmont Commons was assigned to TAZs based on the percentage of the Woodmont Commons development area in each TAZ. In Chester, the population and household growth anticipated to be induced by Alternative A was allocated to TAZs by overlaying the town and TAZ boundaries and assigning population and households based on the percentage of the town area within each TAZ. The anticipated induced population and household growth for Sandown was not assigned to TAZs because Sandown is located in an external zone in the traffic demand model. \({ }^{7}\) Table 24 presents the incremental population, household, and job growth by TAZ that would be induced by Alternative A for the 2040 Build condition. The TAZs shown in Table 24 and Figure 5 (Sheets 1 and 2) are the ones to which growth was assigned. Table 25 shows the total 2040 Build condition anticipated under Alternative A, which includes the 2040 total No Build condition and the incremental growth associated with Alternative A. Appendix D contains detailed tables showing all of the TAZs in the study area and the population, household, and job growth for the 2040 No Build condition and the Build conditions associated with each alternative (A, B, C, D, and F). \({ }^{8}\)

\end{tabular}

Notes: TAZs in this table are those that include population, household, and employment growth from known developments under the No Build condition or incremental growth associated with the Build condition (Alternative A). The whole-town TAZ tables for the entire study area are included in Appendix D. SNHPC background employment data by TAZ is confidential and not available for publication. \(\mathrm{CI}=\) Confidential Information
Auburn is listed as NA because there are no known developments or induced growth anticipated; therefore, population, households, and employment were not allocated to TAZs
The anticipated induced population and household growth for Sandown was not assigned to TAZs because Sandown is located in an external zone in the traffic demand model.

Table 24 shows the incremental population, household, and jobs growth based on the anticipated indirect land use effects of Alternative A. As detailed in Appendix D, the Project would result in the most indirect land use effects under Alternatives A and B, less indirect land use effects under Alternatives C and D, and no anticipated indirect land use effects under Alternative F. The projected indirect land use effects of Alternatives A and B are from the difference in the development approved and expected for Woodmont Commons development with and without the Project, the difference in development on the recently rezoned parcels in the Town of Derry along Folsom Road, and anticipated residential development in the Towns of Chester and Sandown based on improved access to I-93. The projected indirect land use effects of Alternatives C and D are only from the anticipated residential development in the Towns of Chester and Sandown based on improved access to I-93.
The travel demand modeling and traffic impact analyses will utilize the socioeconomic data results of this study as an input, and the details of these analyses will be documented separately in the Traffic and Transportation Technical Report.

\title{
I-93 Exit 4A Supplemental Environmental Impact Statement Land Use Planner Interview Summary - Final 08/05/16 \\ \\ Town of Derry
} \\ \\ Town of Derry
}

Following is a summary of the interview held on July 26, 2016 at the Town of Derry offices. Attendees were as follows:
- Town of Derry - George Sioras, Liz Robidoux, and Mike Fowler
- Louis Berger - Leo Tidd and Kerri Snyder
- RKG Associates - Craig Seymour

\section*{Population and Employment}

The 2010 Comprehensive Plan includes dated population data, and the staff referenced the Granite State Future Project, which resulted in the SNHPC’s Moving Southern New Hampshire Forward Regional Comprehensive Plan (2015). \({ }^{1}\) This report included a 2015 population for Derry between 31,991 (SNHPC) and 33,991 (OEP) (see Attachment A). The decline from previously projected population numbers is based on school age families migrating away from the area, young adults who leave Derry to attend college or seek employment and settle elsewhere, and an aging population.

There was a general discussion of SNHPC's population projections and the towns input. The SNHPC projections include a straight-line assumption and do not consider individual transportation and land development projects. The Derry staff believe that growth generated by Exit 4A would be in addition to the SNHPC projections. In other words, the SNHPC projections would be representative of a "No Build" condition for Exit 4A in Derry.

The staffs provided additional information on population and growth through a school district facilities committee meeting report (see Attachment B).

\section*{Transportation}

Regarding the general discussion of how Exit 4A would affect Derry's plan for transportation facilities and services, if Exit 4A were built, it would make improvements on local roads accessing the exit. If Exit 4A were not built, the Town would have to evaluate how to address transportation needs.

Exit 4A would reduce travel times for residents and business travelers during the afternoon rush hour ingress to Derry. The project is not likely to make a difference for the morning rush hour egress from Derry, as travelers already find other routes to take. There is anecdotal evidence of collateral impacts in that residents report too much traffic or traffic traveling too fast on the more rural roadways southeast of downtown Derry. For example, to avoid Exit 4 and the traffic congestion on Route 102 through Downtown, some commuters leave I-93 at Exit 3 instead and

\footnotetext{
\({ }^{1}\) http://www.snhpc.org/pdf/SNHPCRegionCompPlan2015.pdf
}
take the Route 111 bypass into the southern portion of Derry, followed by navigation northward through Derry on local streets.

The staff discussed the effect of Exit 4A on traffic in downtown Derry. Derry is a "cut-through" town for towns farther to the east (e.g., Chester, Sandown) as drivers access I-93. By providing an alternative route for through-traffic, Exit 4A would alleviate the severe peak hour traffic congestion on Route 102 through downtown Derry, which some believe would be beneficial in terms of economic impacts because it would improve the accessibility to downtown businesses. Others believe that reduced traffic in downtown Derry would result in loss to businesses. The Town of Derry does not have an official position on this issue and has recommended additional study of the benefits and impacts of Exit 4A in the 2010 Comprehensive Plan.

Parts of Derry are primarily built-out, and the staff view the major impacts associated with not building Exit 4A as additional stress on state roads, as there are constraints that preclude expansion of these other roadways to four-lane facilities.

\section*{Development and Land Use}

Since 1990, the explosive growth experienced since the 1960s slowed. Derry's growth management ordinance was instituted in the mid-1990s along with changes in zoning to control density of residential development. In addition, the segmented ownership in the central business district and lack of large parcels of available land for development make substantial growth impracticable. Currently, Derry is experiencing a trend of population decline related to an aging population and an outward migration of young adults as they seek employment and educational opportunities.

The area immediately to the east of I-93, along Folsom Road north of High Street, has been rezoned to encourage higher quality industrial and commercial development near the proposed Exit 4A. There are also residential areas south of Folsom Road and North High Street that might be re-zoned to Industrial/Commercial zoning. The Derry staff indicated Exit 4A could have an effect on the timing and intensity of development/redevelopment in this small industrial-zoned area. Effects on commercial/industrial development in other areas of the Town are not anticipated. The commercial zoning district along the southern end of Rockingham Road (Route 28) was revised in 2013, and there has been some commercial development in that area. In addition, water and sewer services are being expanded along Rockingham Road (Route 28) to continue to encourage commercial development along that corridor.

Although there are no large parcels suitable for large-scale developments, there is a 13-apartment building of market rate apartments planned near the central business district. The staff indicated on the maps provided where the areas had been rezoned to encourage commercial and industrial development as well as the limits of municipal water and sewer service (Attachment C). Beyond the eastern limits of water service, there are private water companies that tie into the Town, but there is no sewer service. The limits of water and sewer service, the lack of large parcels, and the topography in the eastern portion of Derry, serve to limit development. Lot size requirements and conserved land are also factors constraining any major single-family home developments in Derry. Due the large number of development constraints, Derry staff suggested
that any indirect impacts of Exit 4A on residential development would be more likely to occur in other outlying towns such as Chester, Auburn and Sandown.

The Granite State Future Project is the latest in comprehensive planning for Derry, and the Town's comprehensive plan will most likely be updated in 2020.

\section*{Community and Quality of Life}

Derry is considered a large town in New Hampshire, yet it still maintains its small town, cohesive character. There is a good sense of community in Derry. The staff cited a recent election to overturn austere budget cuts because the residents want a "full-service" community for example, they want police and fire service, rather than a volunteer fire department.

The quality of life has improved in Derry over the last 25 years. The growth management ordinance was successful in limiting development, and Derry no longer suffers issues associated with explosive growth (e.g., overcrowded schools). Although some of the retail development Derry used to have is no longer present, the downtown is starting to be revitalized, and the Manchester Road/Crystal Avenue area is beginning to redevelop. There are sufficient plans and policies in place - zoning, capital improvements plan - to maintain Derry's quality of life in the future.

The staff stated that the Exit 4A project would have no effect on the provision, financing, or accessibility of community services. The primary benefit to Derry would be reduced traffic congestion through Downtown, although as noted previously above, some believe that a reduction in traffic downtown has the potential for negative effects on existing businesses.

\title{
DERRY COOPERATIVE SCHOOL DISTRICT \#1 FACILITIES COMMITTEE MEETING
}

May 27, 2015
6:30 PM

AGENDA
- Welcome
- Population Presentation: George Sioras
- Facilities/Space Presentation: Jane Simard and Gary Webster

NEXT MEETING: June \(8^{\text {th }}\) and June \(24^{\text {th }}\) at \(6: 30\) PM at West Running Brook Middle School.

As we move forward all requests for information will be made through the facilitator. This will be an important process to observe to ensure the process runs as smoothly as possible. The Facilitator will be Dr. John Moody. Dr. Moody can be reached at jhmschool@comcast.net.

Population/Growth-Town of Derry Planning Department summary for subcommitteeFacilities Committee

A component of our subcommittee's work was to review future population growth and demographics in the town. Reviewing the growth patterns from the past 50 years as well the current development in town and a future build-out including the expansion of Interstate 93 and the potential Exit 4A, our subcommittee came to the conclusion the growth rate has peaked for the town and will most likely not peak again and how these changes would impact the school system.

Several factors have and will continue to have an impact on the future school population. The primary change has been in the zoning for the town. Zoning changes that began in the late 1990s now have lowered the density for single family lot sizes throughout town. Where in the past most of the town allowed for one-acre lots the requirement today is for one, two, and three-acre minimum lot size for single-family housing. This change has significantly lowered the number of new homes being built in comparison to the large housing developments of the 1960s, 1970s, and 1980 s .
Another more recent zoning change has been in the reduction of the density of multi-family apartments, townhouses, and condominiums. As the town saw large scale multi-family developments beginning in the 1960 s through the 19805 the most recent zoning change this past year has significantly reduced the density allowance for this type of housing. This zoning has and will significantly alter future multi-family housing particularly in the older, more compact neighborhoods of West Derry and the Downtown area which is serviced by municipal sewer and water and is a mandatory requirement in the zoning that multi-family housing shall be connected to the town's utility systems.

A third reason for less population in the future is the changing demographics of both the town and state. Our demographics show an aging population which is reflected in both the 2000 and 2010 Census. Both state and regional planning agencies who monitor and project future growth patterns see this aging population trend to continue well into the future over the next three decades as well as a smaller growth rate in the younger population age group from birth up to young adulthood.

A final factor contributing to the lower population growth of the town since the 1990 s has been the preservation of open space, purchase of parcels of land and easements which reduces the amount of land that would have been potentially a housing development.

As is highlighted in the Town's 2010 Master Plan which was adopted by the Planning Board the demographic and socio-economic trends that face a community are generally the keystone to the major decisions that need to be made in regards to issues such as economic development, land use, housing and growth and thus in turn impact the school system as well.

\section*{ZONING}

HOME
 POPULATION
The SNHPC's 2010 population of 261,262 represents an increase of approximately 5 percent since 2000 . This compares to New Hampshire's 6.5 percent increase from 2000 to 2010 and a 9.7 percent increase nationally. The SNHPC region had 105,829 total households in 2010 . The tables below show the Region's historical and projected population growth. REPORTS AND PUELICATIONS

\section*{Chapter 2 DEMOGRAPHIC TRENDS}

\subsection*{2.0 INTRODUCTION}

The demographic and socio-economic trends that face a community are generally the keystone to the major decisions that need to be made in regards to issues such as economic development, land use, housing and growth.

This chapter will focus on all the different aspects of demographic trends, Population, Housing and Economic development. Comparisons between other towns, the county and the state will provide context and understanding of how Derry is doing overall within the region.

\subsection*{2.1 POPULATION GROWTH TRENDS}

Figure 2.1: Historical Population, Town of Derry

\subsection*{2.2 POPULATION GROWTH PROJECTIONS}

There are an estimated 34,071 people in Derry as of 2008 and with the expansion of I-93, Derry can expect to experience more growth in the coming years, with a projected population of 40,430 in 2030 according to the Office of Energy and Planning. It is important that we plan well for this anticipated growth so that it follows the goals and objectives the town has outlined and so the intensity, patterns, and mix of land uses create a well-balanced, healthy and sustainable community.

Table 2.3 below shows projected populations for Derry, the County, and the State from 2008 through 2030 from the New Hampshire Office of Energy and Planning (NH OEP). These projections are based on the 2000 census and local projections are based on a community's historical share of its respective county's growth.

Table 2.3: Growth Projections 2007-2030

Source: NH Office of Energy and Planning
Table 2.4 below shows a comparative analysis of the NH OEP projections and those done by the Southern New Hampshire Planning Commission (SNHPC). The Commission methodology includes more localized data and assumptions about the Town and its surrounding area than does the OEP Procedure. The Commission makes its projections based on natural growth and net migration. The differences in projections are different by about \(1 \%\), but because the Commission's procedures are more sensitive to local situations the use of these results are recommended.

Table 2.4: Comparative Projections for Derry, 2010-2030

RE: Questions for Moody's

Hi Sue,
Here is the information regarding development over the last 18 months. The past two years have been the most busy in the Planning and Building Departments since 2008. I have highlighted various projects and the status of them as well listed the number of new building lots approved by the Planning Board and permits issued by the Building Department. As you will see it has been steady in our departments. In the past we have forwarded this information to the folks at Moody's in advance so when they call in and have asked me questions they have the information in advance which is helpful Just a suggestion.

\section*{George}

Non-residential development.
1. 72,000 sf self-storage facility-under construction.
2. 45.000 sf self-storage facility-work to begin this summer.
3. Auto custom exhaust garage-work to begin this summer.
4. Cumberland Farms expansion and store façade improvements-completed.
5. 16-bed Assisted Living Facility-under construction.
6. 7,000 sf addition to an Industrial building/summer beach products-work to begin this summer.
7. New landscaping business-under construction.
8. 40,000 sf retail development, Crystal Place, Phase I site work-work to begin this summer.
9. 34,000 sf retail development, Cowbell Corner, Phase I gas station/convenience store-under construction.

Residential development.
1. 65 units of townhouse and apartments which includes 34 townhouses and 31 apartments. All are under construction
2. 40 new single-family house lots approved by the Planning Board. In various stages of permitting.
3. Building-Code Enforcement Office issued 26 residential permits for 2015 and so far to May, 2016, 46 permits will have been issued.

There has been a couple of new economic development initiatives this past year. The Town has extended municipal water and sewer to Route 28 (Rockingham Road) which is a major arterial road which is zoned Commercial with the hope of expanding the town's tax base with future development in this part of town. Also the town has recertified and expanded our existing Economic Revitalization Zones located on Route 28, Manchester Road and Crystal Ave, which incorporate our largest commercial and industrial districts of the town. These zones encourage development and redevelopment opportunities that improve infrastructure and create jobs. New and expanding businesses in these areas are eligible to apply for tax credits against the NH Business Profits Tax and/or the Business Enterprise Tax as administered by the State of New Hampshire Department of Resources and Economic Development.

Lastly, the school enrollment continues to see yearly decreases in the student population and is projected to continue into the next five years. I am a member of the School District's Facilities Study Committee and the Committee has spent
the lest year and a half looking at the district's need for the future. A final report is expected to be completed in June, 2016, and presented to the School Board. In general the enrollment decline is reflective to many communities in New Hampshire which is an aging state, smaller population growth from past decades and less children being born. Even with the residential development cited above the enrollments numbers will not match previous enrollment numbers from the high residential development rates seen during the 1970,1980 s, and 1990 s both in Derry and the State of New Hampshire.

Good Morning Kerri,
The revisions look great. I will also keep you updated as we move along with the potential zoning amendments with the Planning Board and Town Council. Thanks.

George

Cc: Tidd, Leo; Chris Bean; Hodgson (Rydland), Laura; I93-Exit4A-EIS (SM)
Subject: RE: I-93 Exit 4A: Possible Industrial Development in Derry

George,
Based on our conversation on September 13, attached is a revised map showing the parcels in the vicinity of Alternative A that have been recently rezoned as Industrial 4 (north side of Folsom Road), developed parcels zoned as Industrial 6 (south side of Folsom Road), and parcels currently zoned as Medium High Density Residential that will be studied in the coming months to determine if they should be rezoned to Industrial 4 or Industrial 6.

It is my understanding that the Town Council is anticipated to ask the Planning Board to undertake a study of whether or not these parcels should be rezoned. The request is likely to come in late September, and the study would likely take about one year to complete.

I appreciate your review of and comments on the attached map and the information provided in this e-mail regarding the upcoming study.

Regards,
Kerri

Subject: I-93 Exit 4A: Possible Industrial Development in Derry

George, Liz, and Mike,
Based on our interview on July 26, 2016, we understand that the Town of Derry anticipates that
recently rezoned parcels along Folsom Road north of High Street may be redeveloped if Alternative A remains the preferred alternative for Exit 4A.

Attached is a map showing parcels, zoning, and the 2007 DEIS alignments for Alternatives A and B for your review and comment. Would you please comment on or confirm the following?
- The extent of the existing industrial parcels that could experience development or redevelopment as a result of Exit 4A.
- The extent of the existing residential parcels that could be rezoned as industrial to take advantage of the connector road frontage access to Exit 4A.
- List or mark-up the map to let us know of any parcel numbers that should be added or deleted based on what is shown in the attached map.

The results will be used to help identify industrial development that could be induced by the proposed project and will be included in the Land Use Scenarios Technical Report.

If you think a discussion is in order, please let me know what dates and times work for you, and I can call you to discuss the map and possible redevelopment in more detail. Thank you for your time in reviewing the map and providing input as we develop the Build and No Build Scenarios for the technical report.

Regards,
Kerri

\section*{I-93 Exit 4A Supplemental Environmental Impact Statement \\ Land Use Planner Interview Summary Final - 8/8/2016 \\ Town of Londonderry}

Following is a summary of the interview held on July 25, 2016 at the Town of Londonderry office. Attendees were as follows:
- Town of Londonderry - Colleen Mailloux and John Vogl
- Louis Berger - Leo Tidd and Kerri Snyder
- RKG Associates - Craig Seymour

\section*{Population and Employment}

There was a general discussion of SNHPC's population projections and the towns input. The SNHPC projections include a straight-line assumption. Although, Londonderry is currently in a growth phase, the planners believe the 2020 population projection \((31,688)\) included in the Town's 2013 Comprehensive Plan is ambitious.

The Pettengill Road development is industrial and would not contribute to population growth. The Woodmont Commons development has a large residential share and would help push the town toward the 2020 population projection of 31,668. If Woodmont Commons were not built out, the Town's population would likely be lower than projected though it is understood that other projects would likely take its place on the same parcels.

The Town participated in reviewing SNHPC’s population projections presented in the 2013 Comprehensive Plan; however, to date, they have not reviewed any subsequent projections. The I-93 Exit 4A project would contribute to growth by providing access to undeveloped land on the east side of I-93. Such growth is understood to be generally non-residential in nature.

\section*{Transportation}

The Exit 4A project would provide access to the eastern portion of Woodmont Commons. Woodmont Commons will be making some transportation improvements on the west side based on the Development Agreement for Phases I and II. Phase I includes five restaurants, an entertainment venue, and commercial/retail space with residential units on the higher floors. The design plans for Phase I are located on the Town's website. \({ }^{1}\) Phase II is planned to expand upon the development built during Phase I and would include additional single-family residential areas and additional commercial uses west of I-93. These phases of Woodmont Commons would proceed regardless of the Exit 4A project. The planners provided the Woodmont Commons traffic study for Phases I and II of the development (Traffic Impact and Access Study Woodmont Commons PUD Phases I and II, June 2016). As part of the Development Agreement, the agreed upon transportation improvements would be paid for by the developer prior to receiving building permits.

\footnotetext{
\({ }^{1}\) http://www.londonderrynh.org/Pages/LondonderryNH_BComm/Planning/projectsunderreview/
}

The Town does not have other major transportation projects planned. Based on the planning process for the 2013 Comprehensive Plan, bicycle and pedestrian trail connectivity is a high priority for the community, including the potential regional trail crossing near the eastern extent of the Exit 4A preferred alternative alignment. This is a vital link connecting trail networks in both Londonderry and Derry. At this time, no bicycle trails outside of the PUD study area are in development. However, the Woodmont Commons PUD states that accommodations for bicycles will be provided along or parallel to the Primary Street Network of the development and that shared use of streets will be permitted for all other portions of the development.

Exit 4A would not substantially alter travel times on the west side of I-93; it may improve the travel times on roadways east of I-93, including Pillsbury Road/Ash Street (two-lane facility). The planners do not anticipate major changes in travel patterns or transportation needs for Londonderry associated with the Exit 4A project.

\section*{Development and Land Use}

Since 2000, the explosive growth experienced in the 1980s and 1990s has slowed, and the current development trends are based on access to undeveloped or underdeveloped land and presence or absence of municipal services (water/sewer), which affects the density of development. For example, the industrial development occurring on Pettengill Road is driven by undeveloped land with access to Raymond Weiczorek Drive (Manchester Airport Access Road). It is not affected by the Exit 4A project. The planners indicated limits of municipal water and sewer access on the maps provided to indicate the limits for higher density development (Attachment B). The planners also indicated on the maps provided the most likely locations in Londonderry for growth outside of the planned Woodmont Commons area. On the east side of I93, Exit 4A would likely affect the timing and type of growth - the interchange and connector road would provide access and opportunity for commercial, institutional and higher density residential development.

The Woodmont Commons development density with and without Exit 4A was discussed, and the planners indicated that the "without Exit 4A" scenario presented in the approved 2013 PUD was based on design review meetings that included Town staff, project engineers/planners and the Town's review consultant. Thus, the PUD with and without 4A scenarios should not be construed as projections of growth, but rather provide an upper cap on the maximum amount of development that could occur. This explains why less commercial development is allowed on the west side of I-93 without Exit 4A than with Exit 4A, even though Exit 4A would provide no westerly access.

With regard to development associated with Build Alternatives A, B, C, D, and F, the planners stated that growth in Londonderry under Alternatives C and D would be more in line with a No Build Alternative in that they would not provide access to the parcels planned to be developed by Woodmont Commons for commercial and/or institutional use. Given the easterly-only access of Exit 4A, development of the interchange will likely have little effect on the job growth or attraction of industries to the west of I-93. The effects would most likely be experienced east of I-93.

To promote the villages and corridors growth scenario outlined in the 2013 Comprehensive Plan, the planners indicated that higher density development along the transportation corridor is generally acceptable, and the development permitting process allows the villages and corridors growth scenario to happen organically. While the Town is undertaking a zoning update, the planners do not foresee major changes to the way that parcels are currently zoned.

\section*{Community and Quality of Life}

The Town of Londonderry has retained its rural character as it has grown into more of a suburban rural community with high quality schools and rising property values. The industrial development in the northwestern portion of the Town (near the airport) is distribution-based and has increased in value as technology has improved. Through the master planning process, the Town committed to keep the residential areas as residential. Londonderry aims to improve connectivity of its open space and recreational resources by adding bicycle and pedestrian trails.

Exit 4A would provide the opportunity for commercial development, and as a result, an enhanced tax base. The planners indicated that the Exit 4A project would not result in net negative effects on the quality of life or community character because the development impacts will be mitigated through the requirements of the development agreement and the PUD (e.g. traffic mitigation measures as additional phases go through site plan review). Exit 4A would have no effect on the provision, financing, or accessibility of community services.

Darket Basket redevelopment area \\
& Tuesday, September 20, 2016 10:22:00 AM
\end{tabular}

Colleen,
Thank you for providing information regarding the four additional pad sites in the Market Basket redevelopment area. Based on your voicemail, I understand that the four pad sites have not been approved for development. Although they have currently been put aside, based on previous communications you have had with DeMoulas Supermarkets, Inc., it sounds like they have considered a combination of restaurant uses for three of the pads and bank/office/retail for the remaining pad. Based on this, it is possible that they could get about 20,000-30,000 gsf of commercial development from those four pads.

I appreciate your review of and comments on this information.

Regards,
Kerri

\section*{I-93 Exit 4A Supplemental Environmental Impact Statement \\ Land Use Planner Interview Summary- Draft- 8/2/2016 \\ Southern New Hampshire Planning Commission}

Following is a summary of the interview held on July 25, 2016 at the SNHPC office in Manchester. Attendees were as follows:
- SNHPC - Julie Chen, Adam Hlasny, and Jack Munn
- Louis Berger - Leo Tidd and Kerri Snyder
- RKG Associates - Craig Seymour

\section*{Population and Employment}

SNHPC has provided whole-town and zonal (traffic analysis zone [TAZ]) population projections for Derry and Londonderry through 2050 using the cohort-component method. An overview of the SNHPC methodology is provided in a letter provided to the project team by SNHPC (see Attachment A: Letter to George Sioras dated March 14, 2012, regarding population and dwelling unit projections). To generate population cohort and dwelling unit projections for 5-year increments (e.g., 2015, 2020, 2025) for the TAZs, SNHPC uses the following information:
- Birth and death rates from NH Department of Health and Human Services
- Region survival rates using a life table derived from OEP
- SNHPC's own projection of net migration, four scenarios were analyzed (high, middle, low and historical average).
- available land within the TAZs
- housing information/building permits from the towns and OEP

The SNHPC provides letters to each of the Towns (see Attachment A) to gain their input on the population projections.

SNHPC also makes projections for employment based on quarterly employment averages from the State, compared to building permit data to estimate the number of jobs per square foot of non-residential development.

The methods used for the 2015 employment projections differ from those used for the 2010 population projections. The 2010 projections used an ELMI employer database to identify number of employees per company, which were then assigned to the appropriate TAZs; however, this information is not currently available for 2015.

The Moving Southern New Hampshire Forward Plan (2015) mentions I-93 Exit 4A being constructed by 2024, and the travel demand model includes the Exit 4A project as discussed in the following section. However, the SNHPC population projections do not consider additional growth associated with individual transportation or development projects (e.g., Exit 4A/Woodmont Commons). Rather, these population projections through 2050 are considered background growth.

\section*{Transportation}

The Moving Southern New Hampshire Forward Plan (2015) considers individual projects that could affect regional transportation (e.g., I-93 widening) in developing the Future Build traffic volumes. As part of a scenario planning effort, the traffic modeling includes a Fast Build Scenario and a Continued Slow Growth Scenario on a regional level, and the individual projects that would contribute to higher traffic volumes (e.g. potential development induced by Exit 4A/Woodmont Commons, and Pettengill Road are considered to be captured in the Future Fast Build Scenario.

There was a general discussion of the proposed splitting of TAZs in Derry and Londonderry based on the proposed Woodmont Commons development. CLD Engineers proposed the splits (see Attachment B) and will provide additional input so that SNHPC can move forward with the 2015 base year updates for the SDEIS. The same TAZ structure will be used for the base year and all future analysis years.

SNHPC provided a technical report that documents the development and calibration of the 2010 travel demand forecast model (Attachment C).

\section*{Development and Land Use}

Commercial and industrial growth is transportation based. I-93 Exit 4A could improve access for economic development; however, other factors including available land and zoning also play a role in the location of the development.

Expanding the Community Technical Assistance Program (CTAP) through I-93 is listed as a strategic initiative in the SNHPC Regional Plan. Phases I and II of the program were strategic initiatives. Phase III of the CTAP is pending and being coordinated with NHDOT. SNHPC is considering a town survey to gauge needs. For example, SHNPC is currently assisting the Town of Chester with its impact fees program. SNHPC wants to determine needs in the other towns it serves to find out how to make the CTAP most effective.

\section*{Regional Planning Activities}

SNHPC's 2015 Regional Comprehensive Plan has been released. Based on State statutes, the next official update of the comprehensive plan would be in 2020. The next SNHPC planning product will be the housing needs assessment.

\section*{Other Topics}

SNHPC provided suggested contacts with other nearby towns for follow-up questions or information.

March 14, 2012
Mr. George Siroas, AICP, Director
Derry Planning Department
14 Manning Street
Derry, NH 03038
Re: Population and Dwelling Unit Projections

Dear Mr. Sioras:
The Southern New Hampshire Planning Commission (SNHPC) has completed the new population and dwelling unit projections for the region's towns and traffic zones. The projections look at the years 2010-2050. At this point, we would like to share our results with you for your review and comments.

The 2010 US Census counted population for Derry was 33,109 . According to the SNHPC figures, the number of dwelling units in Derry was 13,277 . The SNHPC projected population for 2050 is 34,437 , an absolute change of 1,328 persons, and the projected number of dwelling units is 14,926 , an absolute change of 1,649 units. These projections represent annual compound growth rates of 0.10 percent and 0.29 percent respectively. Please see the attached tables for details on a five-year basis.

The population projection was conducted using the Cohort Component Method. The actual births and deaths used were obtained from the NH Department of Health and Human Services, Bureau of Vital Records. The regional survival rates were calculated using life table derived from Office of Energy and Planning (OEP). The one variable generated by the SNHPC was the projected net migration. Using the past 40 years of net migration, we projected four possible future net migration outcomes: high, middle, low, and historical average. The most probable of the four was selected to generate the final projection; for Derry we used our low net migration projection.

Dwelling Units were projected based on the annual average of the past 40 years of Building Permits issued (1970-2009). The OEP figures from their "Current Estimates and Trends in New Hampshire's Housing Supply, Updates 1989, 1999 and 2009" were used along with "19701979 Estimates of Housing Supply for Towns and Counties in New Hampshire." The building permit data was analyzed and any years with atypical net dwelling unit increases were excluded from the calculation of the annual average. For Derry, the annual average of net dwelling unit increase used in the projection was 42.

Using the totals from the population and dwelling unit projections, the net increase expected for each projected five year increment was distributed to the various traffic zones. Please refer to
the attached traffic zone map for the location of zone boundaries. General assumptions made in this process were that growth rates would remain constant in each traffic zone and zoning ordinances would not change significantly over the projected time span. More specific assumptions were made in determining the amount of growth each traffic zone would receive based on the existing zoning of vacant land, the quantity of vacant land, the location of wetlands, steep slopes, water bodies or other natural development constraints, the existing land use coverage, the planned development area from SNHPC Comprehensive Plan; and the known proposed developments.

In Derry, the following assumptions were made to distribute the dwelling unit increases to the individual traffic zones:
- Traffic zones \(147,128,123\), and 140 would receive the greatest share of dwelling units given the combination of higher density zoning and quantity of buildable residential land, and the residential construction trend of 1990-2010 was to build in these zones.
- Traffic zones \(124,125,126,221,222\), and 223 would receive the least amount of dwelling units due in the case of zone 125 to a lack of residential zoned land, and in the other zones there is little vacant land to support growth other than infill development, despite zoning for the highest densities allowed.

Distribution of population increases to the individual traffic zones were in proportion to dwelling unit increase in the individual traffic zones.

Please review the information in this letter along with the attached supporting tables. We greatly welcome your comments so that our projections will best reflect Derry's future growth. If you have comments or suggested revisions, please contact Julie Chen, Ph.D. within the next two weeks at (603)669-4664 or jchen@snhpc.org. We would be happy to schedule an appointment to sit down with you and review the data in more detail. If we do not hear from you in the next three weeks, we will assume you are comfortable with our projections.

Sincerely,

\section*{SOUTHERN NEW HAMPSHIRE PLANNING COMMISSION}

\section*{CHAPTER 1 INTRODUCTION}

\subsection*{1.1 Overview}

The development and calibration of the 2010 Southern New Hampshire Planning Commission (SNHPC) 24-hour model includes many refinements. This report describes the model and documents the calibration and validation process.

The 2010 model includes all regional roadways of functional class of collectors and higher as well as some local roads. The region was divided into 290 traffic analysis zones and 67 external stations where traffic enters and leaves the region. The model projects average weekday 24 -hour traffic volume for roads in the region.

The SNHPC model is used to perform analyses such as:
- Roadway system deficiencies
- Level of service
- Air quality conformity
- Long range transportation planning
- Transportation improvement program
- Special studies

\subsection*{1.2 Household Travel Survey}

SNHPC contracted with the University of New Hampshire Survey Center to conduct a household travel survey for the region. The 2007 household travel survey collected travel information for respondents on Tuesday, Wednesday, and Thursday during October and November 2007. In addition to providing basic demographic information about each household and its members, the survey documented specific travel characteristics of trips, including number of vehicle occupants, trip purpose, time of day, and trip mode. The survey included 786 households selected randomly from the region's telephone records. The survey data was analyzed by SNHPC using Microsoft Access. The following products from the analysis were used to develop model factors:
- Average number of vehicles available per household per community
- Vehicle - Person cross-classification tables
- Percentage of internal to external trips expressed as a percentage of total trips
- Auto occupancy rates by trip type
- Trip length (duration) frequency by trip type

\subsection*{1.3 Demographics}

Travel survey data and demographic data are essential to developing travel demand models. The demographic data as model inputs includes population, households, number of vehicle available per household, school enrollment by school type and employment.

\subsection*{1.3.1 Base year (2010) model}

\section*{Population and Households}

Population, Dwelling Unit, Households (2010) for each community used U.S. Census data.

\section*{Vehicle Ownership}

The number of vehicles available in a household influences travel behavior much like the number of persons in a household. The SNHPC model uses number of vehicles per household per TAZ as a demographic input. Average vehicle ownership from the 2007 travel survey for communities is shown in the following table. Average vehicles per household by community were then assigned to TAZs.

Table 1.1 Average Vehicles per Household
\begin{tabular}{|l|c|l|c|}
\hline Town & Vehicle & Town & Vehicle \\
\hline Auburn & 2.67 & Hooksett & 2.00 \\
\hline Bedford & 2.40 & Londonderry & 2.14 \\
\hline Candia & 2.50 & Manchester & 2.71 \\
\hline Chester & 1.86 & New Boston & 2.30 \\
\hline Deerfield & 2.76 & Raymond & 2.23 \\
\hline Derry & 2.04 & Weare & 2.65 \\
\hline Goffstown & 2.34 & & \\
\hline
\end{tabular}

\section*{Student Enrollment}

Student enrollment influences the number of trips attracted by schools. Data for 2010 student enrolments for all elementary, middle and high schools in the region were obtained from the New Hampshire Department of Education. College enrollments were collected by contacting the colleges in the region. School addresses were used for assigning a TAZ to an individual school.

\section*{Employment}

Employment data for 2010 was supplied by the New Hampshire Economic and Labor Market Information Bureau (ELMB). The database contained 8,181 records including business name, address, code of North American Industry Classification System (NAICS) and number of employees by month. Average employment for each employer was calculated by averaging monthly employment and excluding months with atypical employment. For some communities, all schools and government employment were located in one address. For such cases, SNHPC contacted those communities and local school district offices to obtain employment data and address for each school and each community department of the community where different physical addresses existed.

SNHPC maintained a roadway database in Microsoft Access in which roads were broken down by TAZs. With the division of TAZ, the database was updated accordingly. The database was used for assigning a TAZ to each employer. While attempting to assign traffic zones for individual employment records, SNHPC found several mistakes in the 2010 employment database which were subsequently corrected after additional research. Because of these corrections, the SNHPC 2010 employment and the ELMB employment did not match. SNHPC's total employment number for the region was approximately 2.3 percent higher.

As a model input, the employment were grouped based on the NAICS code as shown below.
- Retail: 44 and 45
- Service: 22, 48, 49, 51, 52, 53, 54, 55, 56, 61, 62, 71, 72, 81
- Industrial: 21, 23, 31, 32, 33, 42
- Government: 92
- Agriculture: 11

\subsection*{1.3.2 Future Year}

\section*{Population and Households}

Population projections were developed using the Cohort Component Method. Actual births and deaths used were obtained from the OEP and NH Department of Health and Human Services Bureau of Vital Records. The regional survival rates were calculated using life tables derived from OEP. The one variable generated by the SNHPC was the projected net migration. Using the past 40 years of net migration, we projected four possible future net migration outcomes for each community: high, middle, low, and historical average. The most probable of the four was selected to generate the final projection.

Dwelling Units were projected based on the annual average of building permits issued between 1970 and 2009. The OEP’s figures from "Current Estimates and Trends in New Hampshire’s Housing Supply, Updates 1989, through 2009," were used along with "1970-1979 Estimates of Housing Supply for Towns and Counties in New Hampshire". The building permit data was analyzed and those years with atypical net dwelling unit increases were excluded from the calculation of the annual average. 2010-2014 projections were based on 2008 annual dwelling unit increase to account for slower growth which has been the trend since the economic downturn.

Future number of households was calculated by population divided by occupied housing units.

\section*{Vehicle Ownership}

The model assumes that the future average number of vehicles available in a household is consistent with 2010.

\section*{Student Enrollment}

Student enrollments for future years were projected based on the population of the corresponding age cohorts for elementary school, middle school, high school and college.

\section*{Employment}

Employment data for 1990-2010 by community and NAICS code was downloaded from the website http://www.nh.gov/nhes/elmi/covempwag_arch.htm (New Hampshire Economic and Labor Market Information Bureau) for the projections. Growth rates were assumed based on historic employment data by categories and the State projection for 2008-2018. The growth rates were applied to the projections.

Using the community totals for each category of employment projections, the net increase expected for each projected five-year increment was distributed to the traffic zones. It was generally assumed that zoning ordinances would not change significantly over the projected time span. More specific assumptions were made in determining the amount of growth of each traffic zone would receive based on the existing zoning of vacant land; quantity of vacant land; location of wetlands, steep slopes, water bodies or other natural development constraints; existing land use coverage; and known proposed developments.

\section*{CHAPTER 2 TRIP GENERATION}

Trip generation step converts the demographic/land use data into productions and attractions. Households are converted into "production" and employment (retail, service, industrial, government and agriculture, school enrollments) is converted into "attractions". Many pieces of data including much of that gathered from the household travel survey goes into the trip generation step.

\subsection*{2.1 Trip Productions}

\subsection*{2.1.1 Person Trip Data}

SNHPC has expanded trips from four to six trip types by adding school and social trip types. Trip types are as follows.
- Home Based Work (HBW) : Trips with one end at home and one end at work
- Home Based Shop (HBSH) : Trips with one end at home and one end at a shopping establishment
- Home Based Social (HBSO): Trips with one end at home and one end at a social establishment (i.e. movies)
- Home Based School (HBSCH): Trips with one end at home and one end at a school
- Home Based Other (HBO): One end at home and one end anywhere except work, shopping, school or social
- Non-Home Based (NHB): Neither end of the trip at home

Adding two additional trip types will offer more refinement to the model. The 2007 household travel survey collected the "purpose of the trip" which was used to assign a trip type.

\subsection*{2.1.2 Cross-Classification Tables}

Household size and number of vehicles in the household influences person trips by a household. Trip rates from the 2007 household travel survey were found to be lower than national average and adjustments were made based on the national average trip rates per household. The following table shows trip rates by number of vehicles and persons in the household (cross-classification) that were used to generate productions in the model.

Table 2.1 Cross-Classification Trip Table
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline Vehicles (equal to or greater than) & \begin{tabular}{l}
Vehicle \\
(less \\
than)
\end{tabular} & Home based work & Home based shop & Home based social & Home based School & Home based other & Nonhome based \\
\hline \multicolumn{8}{|c|}{Greater than 1 persons per household but less than 2} \\
\hline 0 & 1 & 0.25 & 0.56 & 0.23 & 0.24 & 1.27 & 0.79 \\
\hline 1 & 2 & 0.86 & 1.12 & 0.38 & 0.24 & 1.58 & 1.32 \\
\hline 2 & 3 & 1.12 & 0.84 & 0.43 & 0.24 & 1.58 & 0.78 \\
\hline 3 & 4 & 1.13 & 0.85 & 0.40 & 0.24 & 1.58 & 0.92 \\
\hline 4 & 99 & 1.88 & 0.85 & 0.40 & 0.24 & 1.58 & 0.92 \\
\hline \multicolumn{8}{|c|}{Greater than 2 persons per household but less than 3} \\
\hline 0 & 1 & 0.63 & 0.56 & 0.23 & 0.16 & 1.27 & 0.79 \\
\hline 1 & 2 & 0.85 & 0.83 & 0.51 & 0.37 & 1.72 & 1.39 \\
\hline 2 & 3 & 1.39 & 1.04 & 0.52 & 0.37 & 1.83 & 2.20 \\
\hline 3 & 4 & 1.59 & 0.96 & 0.58 & 0.37 & 1.83 & 1.47 \\
\hline 4 & 99 & 2.40 & 0.96 & 0.58 & 0.37 & 2.03 & 1.47 \\
\hline \multicolumn{8}{|c|}{Greater than 3 persons per household but less than 4} \\
\hline 0 & 1 & 1.26 & 0.56 & 0.23 & 0.41 & 1.53 & 1.57 \\
\hline 1 & 2 & 1.62 & 0.90 & 0.47 & 0.50 & 1.78 & 1.82 \\
\hline 2 & 3 & 1.63 & 0.87 & 0.51 & 0.43 & 2.32 & 2.55 \\
\hline 3 & 4 & 1.75 & 0.96 & 0.58 & 0.39 & 1.40 & 2.49 \\
\hline 4 & 99 & 1.73 & 0.99 & 0.63 & 0.51 & 1.59 & 3.61 \\
\hline \multicolumn{8}{|c|}{Greater than 4 persons} \\
\hline 0 & 1 & 1.26 & 0.56 & 0.47 & 0.65 & 1.53 & 1.84 \\
\hline 1 & 2 & 1.47 & 0.56 & 0.58 & 0.81 & 2.12 & 2.10 \\
\hline 2 & 3 & 1.50 & 0.87 & 0.60 & 0.88 & 1.65 & 2.99 \\
\hline 3 & 4 & 1.49 & 0.69 & 0.40 & 1.01 & 1.68 & 2.77 \\
\hline 4 & 99 & 2.04 & 1.00 & 0.65 & 0.58 & 1.91 & 3.33 \\
\hline
\end{tabular}

\subsection*{2.2 Attractions}

Establishment of trip attraction rates by type were initially based on data from NCHRP 365 and the NH I-93 Transit Investment Study. Adjustments were made to better reflect the number of trips by trip type estimated from the 2007 household travel survey. The final set of attraction rates is shown in the table below.
2.2 Trip Attraction Rates by Trip Type
\begin{tabular}{|l|l|l|l|l|l|l|l|}
\hline Trip Type & \begin{tabular}{l} 
Total \\
Employ \\
ment
\end{tabular} & Retail & Service & Government & Industrial & Agriculture & Households \\
\hline Home Based Work & 1.35 & & & & & & \\
\hline Home Based Shop & & 5.8 & & & & & \\
\hline Home Based Social & & & 0.8 & 0.22 & & & 0.28 \\
\hline Home Based Other & & 3.0 & 0.9 & 0.25 & 0.25 & 0.25 & 0.70 \\
\hline Non-Home Based & & 4.49 & 1.13 & 1.13 & 0.38 & 0.38 & 0.59 \\
\hline
\end{tabular}

School trip rates per student per school type were determined by using the ITE Trip Generation Manual \(7^{\text {th }}\) Edition. The trip attraction rates used in the model are shown in the table below.

Table 2.3 Trip Generation Rate of school
\begin{tabular}{|c|c|c|c|c|}
\hline Trip Type & Elementary & Middle & High School & College \\
\hline Home Based School & 1.00 & 1.40 & 1.50 & 2.10 \\
\hline
\end{tabular}

\subsection*{2.3 Special Generators}

Trips created by individuals living in special facilities such as student dormitory, nursing home and jail are generated using special generators. Manchester Airport was maintained as special generator. The following special generators were in the following TAZs.
1. Manchester Airport (TAZ 64)
2. Southern New Hampshire University dormitory (TAZ 18)
3. Drug Treatment Center (TAZ 34)
4. Hillsborough County Jail in Manchester (TAZ)
5. State Prison for Women in Goffstown (TAZ 286)
6. Saint Anselm College dormitory (TAZ 88)
7. Southern New Hampshire University dormitory (TAZ 118)
8. Saint Anselm College dormitory (TAZ 236)
9. Nursing home in Bedford (TAZ 110)
10. Nursing home in Bedford (TAZ 89)
11. Nursing home in Derry (TAZ 131)
12. Nursing home in Goffstown (TAZ 235)
13. Nursing home in Goffstown (TAZ 87)
14. Nursing home in Manchester (TAZ 19)
15. Nursing home in Manchester (TAZ 7)
16. Nursing home in Manchester (TAZ 38)
17. Nursing home in Manchester (TAZ 52)
18. Nursing home in Manchester (TAZ 28)
19. Nursing home in Manchester (TAZ 29)
20. Nursing home in Manchester (TAZ115)
21. Nursing home in Manchester (TAZ 39)
22. Nursing home in Manchester (TAZ 40)

\subsection*{2.4 External trips}

Factors for each trip type were used for split trips into internal to internal (I-I) trips, internal to external (I-X) trips and external to internal (X-I) trips. I-X factors by trip type
and community were calculated using 2007 household travel survey. For very small samples, the number was adjusted during model calibration. The X-I factors for home based work trips were obtained using work place data from the 2000 Census. The nonwork trips X-I factors were generated based on the 2000 model factors, professional judgment, reasonable assumptions concerning the trip characteristic of commuters and the use of an interactive process during calibration. The factors used in the model were shown in the following tables.

Table 2.4 Internal to External Factor
\begin{tabular}{|l|r|r|r|r|r|r|}
\hline TOWN & HBWIX & HBSHIX & HBSOIX & HBSHCIX & \multicolumn{1}{l|}{ HBOIX } & \multicolumn{1}{l|}{ NHBIX } \\

\subsection*{2.5 Trip Generation Results and Conclusions}

The following table summarizes the trip generation results before balancing, which count for a regional population of 261,262. The average motorized trip rate per capital is 3.1 which fall in the range of national average. The table productions and attractions reflect total trips generated by the region.

Table 2.6 Unbalanced Motorized Productions and Attractions
\begin{tabular}{|l|c|c|}
\hline Trip Type & Productions & Attractions \\
\hline Home Based Work & 151,600 & 162,980 \\
\hline Home Based Shop & 94,546 & 91,396 \\
\hline Home Based Social & 51,582 & 90,615 \\
\hline Home Based School & 41,290 & 100,318 \\
\hline Home Based Other & 207,600 & 193,687 \\
\hline Non-Home Based & 236,622 & 231,053 \\
\hline Total & 783,244 & 870,051 \\
\hline
\end{tabular}

\section*{CHAPTER 3 TRIP DISTRIBUTION}

Trip distribution involves the roadway networks, travel times, and conversion of productions and attractions from the trip generation step into a TAZ level person trip matrix. The data needed for trip distribution comes from the household travel survey.

\subsection*{3.1 Traffic Analysis Zone (TAZ)}

TAZs are geographic areas dividing the planning region into relatively similar areas of land use and land activity. Refinements were made to the 2005 existing TAZs to develop the 2010 TAZs. The 2010 census data boundaries land use type, and major physical and transportation boundaries were all considered in the refinement of TAZs. Total TAZs in each community is shown in the following table. No new TAZs were added to the 2005 model TAZ.

Table 3.1 Number of TAZs
\begin{tabular}{|l|c|l|c|}
\hline COMMUNITY & \# OF ZONES & COMMUNITY & \# OF ZONES \\
\hline Auburn & 5 & Hooksett & 12 \\
\hline Bedford & 25 & Londonderry & 28 \\
\hline Candia & 9 & Manchester & 95 \\
\hline Chester & 8 & New Boston & 10 \\
\hline Deerfield & 10 & Raymond & 17 \\
\hline Derry & 35 & Weare & 19 \\
\hline Goffstown & 17 & TOTAL & \(\mathbf{2 9 0}\) \\
\hline
\end{tabular}

\subsection*{3.2 Network}

The model network was adopted from 2005 network. Attributes used in the network includes A node, B node, distance, speed, SPDclass, CAPclass, Lanes, Count, KFAC, Town, CNT93, CNT94, CNT94, CNT95, CNT96, CNT97, ONETWOWAY, Type, CNT98, CNT99, CNT01, Totalest05 and Totalest10. Network roadways are functionally classified, including collectors and higher and some local road. To improve forecasting accuracy and meet needs of planning process, Totalest10 (for validation purpose) were added to the network. Network links were examined and inappropriately coded links were corrected based on local knowledge.

\subsection*{3.2.1Functional Class}

Function class as an attribute of links were coded in the network. Functional classes used are shown in the following table.

Table 3.2 Functional Class Classification
\begin{tabular}{|l|l|}
\hline \multicolumn{2}{|l|}{ Rural } \\
\hline Code & Descriptions \\
\hline 01 & Principal Arterial - Interstate \\
\hline 02 & Principal Arterial -Other \\
\hline 06 & Minor Arterial \\
\hline 07 & Major Collector \\
\hline 08 & Minor Collector \\
\hline 09 & Local \\
\hline Urban & \\
\hline Code & Descriptions \\
\hline 11 & Principal Arterial - Interstate \\
\hline 12 & Principal Arterial -Other Freeway and Expressway \\
\hline 14 & Minor Arterial \\
\hline 16 & Major Collector \\
\hline 17 & Minor Collector \\
\hline 19 & Local \\
\hline
\end{tabular}

NHDOT GIS data was used to identify roadway functional class.

\subsection*{3.2.2 Facility type}

Facility type plays important roles in model calibration.
Network roadways were classified by 16 facility types based on roadway characteristics such as capacity and speed. Capacities were calculated based on 2000 Highway Capacity Manual (HCM) and adjusted during model calibration. Capacity and speed by facility types are presented in table 3.3.

Table 3.3 Facility Type
\begin{tabular}{|c|l|l|l|l|}
\hline Code & Facility Type & Description & Capacity/lane & Speed \\
\hline 1 & \begin{tabular}{l}

\hline 17 & Urban Collector & Functional class 17 & 1100 & 25 \\
\hline 18 & & & & 20 \\
\hline 19 & Urban Local Road & Functional class 19 & 500 & 20 \\
\hline
\end{tabular}

\subsection*{3.2.3 Speed}

Average roadway speeds coded into the network were obtained from the SNHPC Congestion Quantity Study if it was included in the study or from the above table.

\subsection*{3.2.4 Model Capacities}

Model capacities listed in the above table, calculated based on information in the Highway Capacity Manual 2000 were subjected to change during model calibration.

\subsection*{3.3 Terminal Times}

Terminal times added to the beginning and end of a trip (TAZ to TAZ), were inherited from the 2005 model. TAZ terminal times were saved in Terminal.dbf file.

\subsection*{3.4 Turn Restrictions/Penalties}

The model includes turn restrictions to reflect actual traffic operations at certain locations. Most delays at intersections derived from the 2005 model. Delays were estimated using Synchro for the intersections with turning movement counts were done since 2005. Delays at toll plazas were modified to reflect the addition of open road
tolling. Restrictions at interchange ramps and one way streets were added to the delay file.

\subsection*{3.5 External to External Trip Table}

Percentages of external - external trips from the 2005 model were carried over to the 2010 model. Traffic volumes at these external stations were updated by using 2010 traffic estimates.

\subsection*{3.6 Friction Factors}

Friction factors for the 2005 model were carried over to the 2010 model.

\subsection*{3.7 Trip Length Frequency Distribution Curves Comparisons}

Following figures and tables compare the trip length frequency distribution developed from the household travel survey and the model results for each trip type.

Table 3.5 Trip Length Frequency Distribution
\begin{tabular}{|l|r|r|r|r|r|r|r|r|r|r|r|r|}

\hline\(>36\) & 4.24 & 0.70 & 0.00 & 0.30 & 0.00 & 0.70 & 3.06 & 0.00 & 0.68 & 0.60 & 1.62 & 0.40 \\
\hline
\end{tabular}

Figure 3.1 Home Based Work Trip Length Frequency

Figure 3.3 Home Based Other Trip Length Frequency

Figure 3.4 Home Based Social Trip Length Frequency

Figure 3.5 Home Based School Trip Length Frequency

Figure 3.6 Non-Home Based Trip Length Frequency

\subsection*{3.8 Trip Distribution Conclusions}

Based on the previous table and figures, similarities of trip length frequency between the 2007 household survey and the model are shown. The results of the trip distribution process were reasonable.

\section*{CHAPTER 4 TRUCK TRIP MODELLING}

Trip generation step only captures household-based trips rather than commodity-based trips. To generate commodity-based trips, a truck trip table was developed based on Quick Response Freight Manual and NCHRP Synthesis 298, Truck Trip Generation Data.

\subsection*{4.1 Truck Trip Generation}

Employment data used as inputs to the model were grouped as follows according to the NAICS codes:
- Agriculture, Mining and Construction (NAICS: 11, 21, 22, 23)
- Manufacturing, Transportation/Communications/Utilities (NAICS Code: 31, 32, 33, 42, 48, 49)
- Retail Trade (NAICS Code: 44, 45, 72)
- Offices and Services ( NAICS Code: 51, 52, 53, 54, 55, 56, 61, 62, 71, 81, 92)

Besides the four employment categories, number of household was another variable for truck trip generation.

Because of a lack of local truck trip rate data for industrial categories, trip rates data shown below in table 4.1 from "Quick Response Freight Manual", was used. Truck trip rates were adjusted during calibration.

Table 4.1 Trip Generation Rate
\begin{tabular}{|l|l|l|l|l|l|}
\hline Category & \begin{tabular}{l} 
Agriculture, \\
Mining and \\
construction \\
\((11,21,22,23)\)
\end{tabular} & \begin{tabular}{l} 
Manufacturing, \\
transportation/ \\
communications/ \\
Utilities \\
\((31,32,33,42,48,49)\)
\end{tabular} & \begin{tabular}{l} 
Retail \\
Trade \\
\((44,45,72)\)
\end{tabular} & \begin{tabular}{l} 
Offices and Services \\
\((51,52,53,54,55,56,6\) \\
\(1,62,71,81,92)\)
\end{tabular} & Households \\
\hline \begin{tabular}{l} 
Trip \\
Rate
\end{tabular} & 0.865 & 0.706 & 0.663 & 0.283 & 0.213 \\
\hline
\end{tabular}

The percentage of internal-external and external-internal in total truck trips in each TAZ was assumed to be similar to the 1990 truck trip table. The data was saved in the file IXper.DBF.

\subsection*{4.2 Truck Volumes at External Stations}

Vehicle classification counts at external stations were used to estimate truck volume at these stations. For external stations where no data was available, default truck percentage was estimated from FHWA data, Census’ Truck Inventory User Survey which can be found in the Quick Response Freight Manual or from adjacent roads with similar functional class. Truck volumes at external stations were stored in the file 10NBTRKEXT.dbf.

Six types of truck trip were generated. They are Productions, Productions of IX, Productions of XI, Attractions, Attractions of IX, and Attractions of XI.

\subsection*{4.3 Truck Trip Distribution}

The TP+ software standard gravity model was used for truck trip distribution. A trip table representing the origins and destinations of individual truck trips was produced in the process. Fraction factors for use with the gravity model were based on travel time between analysis areas. Travel time was calculated using model network. The factors for all types of truck trips were calculated using a formula in Quick Response Freight Manual showing as follows.
\[
F_{i j}=e^{-0.1 t_{i j}}
\]

Where:
\(\boldsymbol{F}_{i j}\) - Fraction factor.
\(\mathbf{t}_{\mathbf{i j}}\) - Travel time in minutes between analysis areas.
The factors were saved in the file 05NBTRKFRA.dat.

\subsection*{4.4 Input Files and Output File}

In this process, following files fed into TP+ script to produce truck trip table.
10NBTRKSCO.DBF
10NBTRKEXT.DBF
IXper.DBF
10NBNETWORK.NET
10NBdelay.prn
10NBTRKFRA.DAT

\section*{Output File}

10NBTRKOD.MAT

The truck trip table along with the passenger vehicle trip table and the external-external trip table were loaded onto the Viper Network in the trip assignment step.

\section*{CHAPTER 5 EXTERNAL TO EXTERNAL TABLE}

\subsection*{5.1 Introduction}

External stations in travel demand models are locations on the highway network through which trip travel in and out of the region. There are basically three types of movements through these external stations: internal to external (I-X), external to Internal (X-I), and External to External (X-X). The I-X trips have their origin inside the region and destination outside the region; the X-I trips have origin outside the region and destination inside the region; and \(\mathrm{X}-\mathrm{X}\) trips have both origin and destination outside the region. I-X and X-I trips are calculated in the trip generation process in the travel demand model. However, the X-X trips table, as a component of the regional travel demand model, has to be created externally (not using travel demand model) and to be integrated with the regular trips and truck trips for ultimate travel demand forecasting.

Basically, there are two methods to create a XX trip table: (1) Using equations such as those presented in Chapter 5 of the NCHRP report 365; (2) using an Origin-Destination (O-D) survey. An Origin-Destination survey was used to create XX trip table for the region.

\subsection*{5.2 O-D Survey}

Generally, there are four O-D survey methods to collect information on the current trip: (1) License plate survey, (2) roadside hand survey, (3) roadside interview survey, and (4) combined roadside interview and handout survey. The roadside hand survey is the most cost efficient method and results in fewer traffic delays. As a result, a roadside hand survey was used to complete the O-D survey in 2007.

In the regional model, 67 external stations exist as 291 to 357. Total Annual Average Daily Traffic (AADT) traveling through these stations is 157,189 vehicles. To survey each station is time, labor, and finance consuming, so to survey all stations is unfeasible. As a result, 1990 XX trip table was examined to select survey locations. In case that percentage of XX trip in total traffic volume per station is unrealisticly high, the station
was selected as a potential location for the survey. Nine locations were selected for the OD survey. For all stations exclusive of these nine, percentage of XX trip in total traffic volume per station was carried over from the order model. A summary of the survey responses for each of the location is shown in Table 5.1 below.

Table 5.1 O-D Survey Locations
\begin{tabular}{|l|c|r|r|}
\hline \multicolumn{1}{|c|}{ LOCATION } & LOCID & \begin{tabular}{l} 
Card \\
Needed
\end{tabular} & \begin{tabular}{l} 
Card \\
Received
\end{tabular} \\
\hline F.E.E.E TPK AT Bedford Toll Plaza, NB & 037100 & 3500 & 144 \\
\hline I-93 at Hooksett Toll Plaza, SB & 225083 & 3500 & 349 \\
\hline BEALS RD AT MERRIMACK T/L Over Baboosic Brook & 037091 & 300 & 28 \\
\hline STOWELL RD AT MERRIMACK T/L & 037130 & 250 & 10 \\
\hline North Amherst RD at Amherst T/L & 037074 & 380 & 38 \\
\hline Black Brook Road at Dunbarton T/L & 175308 & 230 & 22 \\
\hline RESERVOIR DR AT DEERING T/L & 471803 & 390 & 21 \\
\hline SUGAR HILL RD NORTH AT HOPKINTON T/L & 471801 & 470 & 21 \\
\hline PINE ST AT BOW T/L & 225369 & 700 & 49 \\
\hline
\end{tabular}

Number of vehicles requested for the survey based on the 2005 traffic volume per location was calculated using statistical methods. These numbers are also shown in table 5.1. The sample sizes were determined through an assumed confidence level of 95 percent and confidence interval of 4 percent.

\subsection*{5.3 X-X Trip Table}

To create the X - X trip table, following steps were taken:
1. The percentage of XX traffic volume in total traffic volume per station was computed using 2007 O-D survey data or 1990 XX trip table data.
2. The percentage of XX traffic volume of each O-D pair in total traffic volume of the origin station was calculated using 2007 O-D survey data or 1990 XX trip table data.
3. Unrealistic percentages were adjusted.
4. XX traffic volumes were distributed to each O-D pair according to the percentage of XX traffic volume from step 2 to get unbalanced XX trip table.
5. The unbalanced excel XX trip table was converted to a format that TP+ can be read by running the excel2TP visual basic script. The results will be saved in XXTPUNB2010 sheet.
6. Copy the sheet to OD2010.txt file.
7. Run TP+ Script to balance the XX trip table and the output XX trip table and vector.
8. Run Matrix Visual Basic script to convert the TP+ format data, the vector to an excel format trip table.

\section*{CHAPTER 6 TRIP ASSIGNMENT}

In the process of trip assignment, trips in trip table, which are output of the trip distribution step, load onto the highway network to produce estimates of traffic volumes, congested speed, Vehicle Miles Traveled (VMT), and Vehicle Hours Traveled (VHT). Prior to assigning vehicle trips to the roadway network, the conversion of people trips to vehicles trips is done at the trip generation phase for each trip type.

\subsection*{6.1 Auto Occupancy Rates}

The following auto occupancy rates used to convert person trips to vehicle trips were established using the 2007 household travel survey data.

Table 6.1 Auto Occupancy Rates, 2007
\begin{tabular}{|l|c|}
\hline Trip Type & Auto Occupancy (Person/vehicle) \\
\hline Home Based Work & 1.31 \\
\hline Home Based Shop & 1.36 \\
\hline Home Based Social & 1.65 \\
\hline Home Based School & 2.37 \\
\hline Home Based Other & 1.50 \\
\hline Non-Home Based & 1.45 \\
\hline
\end{tabular}

Once trips are converted to vehicle trips they are assigned to the network using a gap parameter of 0.0001 and volume-delay functions.

\subsection*{6.2 Volume - Delay Function}

Trip assignment assigns vehicle trips to the roadway network using equilibrium assignment based on the assumptions that people will use the shortest time path and have "perfect" information about the routes available. Trips for each O-D pair are assigned to the links on the minimum path and trips are totaled for each link. The assigned trip volume is then compared to the link capacity to determine congestion. If a link is congested, the travel time is adjusted to result in a longer travel time. Changes in travel time means that the shortest path may change. This process is repeated several times (iterated) until there is an equilibrium between travel demand and travel supply. Trips on congested links will be shifted to uncongested links until this equilibrium condition occurs.

Traffic assignment step is influenced by the relationship between assigned volume and delay caused by congestion. Volume - delay function used to determine this relationship is shown below.

TC [1] = T0 * VDF (Linkclass, VC)
A set of factors were set based on the link class and V/C ratio.
; V/C RI, UI, UPAO, RMiA, UMi_A,RMC, UC, U_Exp, R_Exp, RL, UL, Centroid \(R=" 0.00,1.000,1.000,1.000,1.000,1.000,1.000,1.000,1.000,1.000,1.000,1.000,1.000 "\), " \(0.10,1.002,1.001,1.004,1.018,1.010,1.190,1.190,1.010,1.020,1.200,1.200,1.030 "\),

\section*{Chapter 7 Model Validation}

Highway assignment is crucial for model to produce traffic volume estimates within acceptable ranges of tolerance compared to actual ground counts. Comparisons of VMT estimates between the model, the Highway Performance Monitoring System (HPMS) and SNHPC traffic count program are summarized in this chapter along with assignment statistics. EPA mandates a 3 percent difference of VMT estimates between the model and HPMS as an acceptable tolerance level for regional air quality planning and conformity purposes. A comparison of traffic volumes between model estimates and ground count screen line and cordon line are presented in this chapter as well as validation results of traffic volumes on individual links.

\subsection*{7.1 Vehicle Miles Travelled}

Because HPMS VMT estimates of 2010 are unavailable in New Hampshire, model VMT estimates were compared with 2010 VMT of the SNHPC Traffic Count Program. If traffic volume for a link was not available in traffic count program, estimates for the traffic volume on adjacent links were used. Region wide VMT calibration results are shown in the following table by functional class. The results show that region-wide VMT calibration meets the FHWA target percentage for VMT difference between the model and ground counts.

Table 7.1 Model VMT Estimates Verse VMT of Traffic Count Program
\begin{tabular}{|l|l|l|l|}
\hline \begin{tabular}{l} 
Functional \\
Class
\end{tabular} & \begin{tabular}{l} 
2010 VMT Estimates of Traffic \\
Count Program
\end{tabular} & \begin{tabular}{l} 
2010 Model \\
VMT
\end{tabular} & \begin{tabular}{l} 
\% \\
Difference
\end{tabular} \\
\hline 1 & 389,965 & 405,956 & \(3.94 \%\) \\
\hline 2 & 401,994 & 428,680 & \(6.23 \%\) \\
\hline 6 & 80,375 & 96,125 & \(16.39 \%\) \\
\hline 7 & 381,212 & 432,241 & \(11.81 \%\) \\
\hline 8 & 85,489 & 99,278 & \(13.89 \%\) \\
\hline 9 & 258,656 & 286,314 & \(9.66 \%\) \\
\hline 11 & \(1,864,079\) & \(1,809,259\) & \(-3.03 \%\) \\
\hline 12 & 399,050 & 415,206 & \(3.89 \%\) \\
\hline
\end{tabular}
\begin{tabular}{|l|l|l|l|}
\hline 14 & 860,674 & 791,242 & \(-8.78 \%\) \\
\hline 16 & \(1,177,920\) & \(1,201,258\) & \(1.94 \%\) \\
\hline 17 & 493,457 & 511,284 & \(3.49 \%\) \\
\hline 19 & 267,790 & 257,720 & \(-3.91 \%\) \\
\hline Total & \(\mathbf{6 , 6 6 0 , 6 6 0}\) & \(\mathbf{6 , 7 3 4 , 5 6 1}\) & \(\mathbf{1 . 1 0 \%}\) \\
\hline
\end{tabular}

In New Hampshire, 2008 HPMS VMT estimate was available for model calibration. To produce 2008 model VMT estimates, 2008 social economic data was applied to the 2010 model network. A comparison of VMT between 2008 HPMS and 2008 model generated is made in the following table. The table shows that the model VMT estimates satisfy the EPA requirement.

Table 7.22008 Model Estimate Versus 2008 HPMS VMT Estimates
\begin{tabular}{|c|c|c|c|}
\hline 2008 HPMS VMT & 2008 Model VMT & \% Difference & \begin{tabular}{l} 
Target for \% \\
Difference (EPA)
\end{tabular} \\
\hline \(6,606,565\) & \(6,773,936\) & 2.53 & 3 \\
\hline
\end{tabular}

\subsection*{7.2 Traffic Volume}

\subsection*{7.2.1 Region wide}

After validation of the VMT, the next level of validation of the highway assignment involves comparison of observed versus estimated traffic volume on the highway network. Two measures, the Coefficient of Determination ( \(\mathrm{R}^{2}\) ) and Percent Root Mean Square of the Error (\%RMSE), to examine performance of the model were calculated using following equations:
\[
R^{2}=[\operatorname{Correl}(\text { Model }, \text { Count })]^{2}
\]

Where: Correl=Correlation Coefficient
\[
\begin{gathered}
\operatorname{Correl}(\text { Model,Count }) .=\frac{\sum_{j}(\text { Model }- \text { Ave.Model })(\text { Count }- \text { Ave.count })}{\sqrt{\sum_{j}(\text { Model }- \text { Ave.Model })^{2}(\text { Count }- \text { Ave.count })^{2}}} \\
\% R M S E=\frac{\left(\sum_{j}\left(\text { Model }_{j}-\text { Count }_{j}\right)^{2} /(\text { Numberofcounts }-1)^{0.5} * 100\right.}{\left.\sum_{j} \text { Count }_{j} / \text { NumberofCounts }\right)}
\end{gathered}
\]
\(\mathrm{R}^{2}\) region wide equals 0.90 which is greater than FHWA requirement which is 0.88 . \%RMSE equals 27.55 for all roadways with functional class collector and higher which is less than the commonly accepted FHWA standard 30.

\subsection*{7.2.2 Screen Line and Cordon line}

Total observed versus model estimated volumes at a Merrimack River screen line crossing and external stations cordon line crossings were compared in the following table. The table shows both absolute percentage differences are less than 2 percent.

Table 7.3 Total Observed Versus Model Estimates Traffic Volumes
\begin{tabular}{|l|c|c|c|}
\hline Criteria & 2010 Ground Count & 2010 Model & \% Difference \\
\hline \begin{tabular}{l} 
Daily traffic volume at all \\
external stations
\end{tabular} & 493,818 & 481,120 & \(2.64 \%\) \\
\hline \begin{tabular}{l} 
Merrimack River screen line \\
crossing
\end{tabular} & 247,016 & 246,000 & \(0.41 \%\) \\
\hline
\end{tabular}

\subsection*{7.2.3 Individual Links}

A comparison of the actual ground count to assignment on a link by link basis is one of the more severe tests for a regional model. As can be seen from Figure 7.1, the ground count and model assignment pairs compared fell within the FHWA validation criteria.

Subject: I-93 Exit 4A: SNHPC Interview Summary
Julie, Jack, and Adam,
Thank you for taking the time to meet with us on July 25. Attached is a draft summary of our discussion for your review and comment. In addition, we respectfully request the following information.
1. Confirmation of 2050 as the outlook year for the population projections. This is what is stated in the letter to the Town of Derry. Also, is 2012 the date the most recent projections were created (when letter is dated)? Were the projections updated in 2014? If so, is the outlook year still 2050?
Yes. We have projections up to 2050. The projections haven't updated since 2012.
2. Copies of the letters (similar to the copy you provided for the Town of Derry) sent to the towns in the SNHPC area requesting input on the population projections.

Attached.
3. Results of a search SNHPC files to determine if Derry or Londonderry submitted comments in response to the letters from SNHPC in 2012 explaining the updated population and dwelling unit projections.
Don't have any records showing comments on population and dwelling projection from the two towns. But we did contact Londonderry for employment projection regarding Pettengill Road and Woodmont Common. We adjusted TAZ level employment allocations for Pettengill Road development. At that time, it is too early to tell how many jobs will be created by Woodmont Common.

March 14, 2012
Mr. Andre Garron, AICP, Director
Londonderry Community Development Department
268B Mammoth Road
Londonderry, NH 03053
Re: Population and Dwelling Unit Projections

Dear Mr. Garron:
The Southern New Hampshire Planning Commission (SNHPC) has completed the new population and dwelling unit projections for the region's towns and traffic zones. The projections look at the years 2010-2050. At this point, we would like to share our results with you for your review and comments.

The 2010 U.S. Census counted population for Londonderry was 24,129. According to the SNHPC figures, the number of dwelling units in Londonderry was 8,771 . The SNHPC projected population for 2050 is 37,623 , an absolute change of 13,494 persons, and the projected number of dwelling units is 13,044 , an absolute change of 4,273 units. These projections represent annual compound growth rates of 1.12 percent and 1.00 percent respectively. Please see the attached tables for details on a five-year basis.

The population projection was conducted using the Cohort Component Method. The actual births and deaths used were obtained from the NH Department of Health and Human Services, Bureau of Vital Records. The regional survival rates were calculated using life table derived from Office of Energy and Planning (OEP). The one variable generated by the SNHPC was the projected net migration. Using the past 40 years of net migration, we projected four possible future net migration outcomes: high, middle, low, and historical average. The most probable of the four was selected to generate the final projection; for Londonderry we used our low net migration projection.

Dwelling Units were projected based on the annual average of the past 40 years of Building Permits issued (1970-2009). The OEP figures from their "Current Estimates and Trends in New Hampshire’s Housing Supply, Updates 1989, 1999 and 2009" were used along with "19701979 Estimates of Housing Supply for Towns and Counties in New Hampshire." The building permit data was analyzed and any years with atypical net dwelling unit increases were excluded from the calculation of the annual average. For Londonderry, the annual average of net dwelling unit increase used in the projection was 116.

Using the totals from the population and dwelling unit projections, the net increase expected for each projected five year increment was distributed to the various traffic zones. Please refer to the attached traffic zone map for the location of zone boundaries. General assumptions made in this process were that growth rates would remain constant in each traffic zone and zoning ordinances would not change significantly over the projected time span. More specific assumptions were made in determining the amount of growth each traffic zone would receive based on the existing zoning of vacant land, the quantity of vacant land, the location of wetlands, steep slopes, water bodies or other natural development constraints, the existing land use coverage, the planned development area from SNHPC Comprehensive Plan; and the known proposed developments.

In Londonderry, the following assumptions were made to distribute the dwelling unit increases to the individual traffic zones:
- Traffic zones 101,100 , and 102 would receive the greatest share of dwelling units given the quantity of buildable residential land, and residential construction trends of 19902010.
- Traffic zones 64L, 284, and 65 would receive the least amount of dwelling units due to less buildable residential land than elsewhere, and the industrial nature of zones 64 and 65.

Distribution of population increases to the individual traffic zones were in proportion to dwelling unit increase in the individual traffic zones.

Please review the information in this letter along with the attached supporting tables. We greatly welcome your comments so that our projections will best reflect Londonderry's future growth. If you have comments or suggested revisions, please contact Julie Chen, Ph.D. within the next two weeks at (603) 669-4664 or jchen@snhpc.org. We would be happy to schedule an appointment to sit down with you and review the data in more detail. If we do not hear from you in the next three weeks, we will assume you are comfortable with our projections.

Sincerely,

\section*{SOUTHERN NEW HAMPSHIRE PLANNING COMMISSION}

David J. Preece, AICP
Executive Director/CEO
cc: SNHPC Representatives:
Sharon Carson, Arthur Rugg, Donald Moskowitz, Deborah Lievens, Leitha Reilly, Martin Srugis
4. Confirmation of the source of the employer database used in the 2010 population projections
NHDOT got employment database form NH Employment Security.
5. The 2015 plan makes reference to a critical document to request from SNHPC in transmittal: "Economic Impact of Mixed Use/Commercial Developments in Rockingham County, March 2014. Would you provide a copy of this document?
You can find how we used the Results of the Economic Impact Final Report in the attached Land Use Chapter of Moving Southern NH Forward Regional Comprehensive Plan 2015-2035 pages 48-55. Also see future employment growth pages 26-28 in attached Economic Development Chapter. The BEA 2014 Report using the REMI model is also attached.
6. We have reviewed the technical report that outlines the methodology for and calibration of the model. Have there been any major updates to the model since this documentation was prepared?
Since then we added Windham and Francestown to the regional model. Right now we have three models: Original model including thirteen communities, Original model + Windham (2013), Original model + Windham + Francestown (2014). The three models used same methodology, social economic data and projections.
7. During the meeting, you mentioned that the next SNHPC planning effort was the housing needs assessment. Is there a timeline for estimated completion of this assessment?
The last full housing needs assessment was in 2010 with an update in 2015. Please refer to Housing Chapter in Moving Southern NH Forward Regional Plan 2015-2035

We look forward to your comments on the draft interview summary as well as the aforementioned information requests.

\section*{Regards,}

Kerri

\section*{I-93 Exit 4A Supplemental Environmental Impact Statement Land Use Planner Interview Summary- Draft 8/2/2016 \\ NH Office of Energy and Planning}

Following is a summary of the interview held on July 26, 2016 at the OEP office in Concord. Attendees were as follows:
- OEP - Ken Gallager
- Louis Berger - Leo Tidd and Kerri Snyder
- RKG Associates - Craig Seymour

\section*{Population}

OEP's last release of official state population projections for the state, counties, and municipalities was in 2013 (Attachment A). OEP is currently working on 2016 population projections, which are anticipated to be complete in September 2016. The factors behind the need the update the 2013 projections include OEP's 2015 population estimates and the change in migration of populations within the State. The vital statistics/trends have not changed, but migration to southern New Hampshire is greater than anticipated at the time the 2013 projections were prepared and migration to the northern and western portions of the State is less than anticipated.

The methods used to generate the population projections are outlined in the 2013 report \(^{1}\), and the 2016 projections are based on the same methods (i.e., cohort projections, IRS data, and migration rates). Differences in net-migration rates are shown in Attachment A. The OEP conducted a meeting with the regional planning commissions to reach consensus on the migration rates to be used in the population projections. The group reached consensus on using 2000-2005 migration rates, reflecting a moderate growth outlook more positive than the late 2000's, but not as robust as the 1990's.

In allocating county-level population projections to towns, OEP based on share of population in each town and how that share has changed between 2000 and 2010. In other words, the projections assume that the current trend in each town will continue, fast growing towns will continue to grow faster than the county average and slower growing towns will experience less growth.

The group discussed the trend of declining populations in Derry due to the aging of the population. Derry experienced a population loss of 1,000 between the 2000 and 2010 Census; however, the population losses in the younger cohorts were greater. Population estimates consider the number of dwelling permits issued, though it was noted that number of dwellings can lead to an overestimate that is adjusted in comparison to Census estimates.

\footnotetext{
\({ }^{1}\) https://www.nh.gov/oep/data-center/documents/2013-projections-municipalities.pdf
}

The Exit 4A project and related potential for land development was not considered by OEP explicitly or implicitly in making the latest population projections. The group discussed that the situation with Exit 4A is different than the situation with the I-93 Salem to Manchester project where coordination with OEP led NHDOT and FHWA to conclude that the OEP projections represented a "Build" scenario for purposes of the I-93 SEIS. I-93 is of major economic importance to the state, and links New Hampshire to economic activity in Massachusetts and Boston metro area. As a result, the I-93 SEIS concluded growth would be lower along the I-93 corridor without the widening because the level of traffic congestion would rise to level that would adversely impact economic development. Projects such as Exit 4A that not have a large regional effect are not considered in OEP's projection process, as a result OEP agreed that their projections best represent a "No Build" scenario for purposes of the Exit 4A project. In other words, the OEP projections do not already include growth that would potentially be caused by Exit 4A (such as additional build-out of Woodmont Commons). Large scale planned developments, such as Woodmont Commons, are not included in the population projections; however, these developments would be represented in the population estimates after the development is completed.

\title{
State of New Hampshire, Regional Planning Commissions County Population Projections, 2016 Preliminary Version 2 - Migration Scenarios
}

At the Regional Planning Commission meeting of April 18, it was decided to use the latest Census and OEP population estimates and reported vital statistics data to establish the 2010 to 2015 population change benchmark. The projection scenarios presented here use fertility, mortality and migration rates calibrated to the known input targets and then explore future migration rate changes to the year 2040.

The data inputs for the projections model include: the 2010 Census population by age and sex, special population distributions by age and sex (college, prison and nursing home populations), fertility patterns by age of mother, survival distributions by age and sex, and migration patterns by age and sex. The model is calibrated to these inputs for the 2010 to 2015 experience as defined by the actual reported data and estimates results. The projection scenarios to 2040 are based on the 2015 targets and future assumptions of possible migration patterns based on historical migration rates. The scenarios presented here illustrate the impact of migration rate changes alone. Fertility and mortality assumptions are held constant in each of the scenarios presented.

\section*{Historical Net Migration}

Age patterns of migration can remain remarkably stable through fluctuating economic cycles. But the Crude Migration Rate (the total net migrants divided by the beginning period population) is directly impacted by the economy and, in particular, long-term cycles of employment and housing market shifts. The most recent economic recession provides a good example of this impact with some areas showing recovery much more quickly than others.

In establishing future scenarios of net-migration for New Hampshire counties, it is useful to look at historical migration rates as a baseline for future assumptions. Table 1 presents 5-year migration rates by county for each 5 -year period from 1990 to 2015 . These rates are derived by breaking down the total population change for the period into the components of births, deaths and the residual net-migration. The total county population is obtained from the decennial census results for 1990,2000 and 2010, adjusted to a July 1 reference date. The Census Bureau's intercensal estimates provide the mid-decade population for 1995 and 2005 and the most current OEP and Census estimates are used for 2015. The birth and death data are based on the New Hampshire Vital Records Information Network web query system and New Hampshire Department of Health and Human Services vital statistics reports.

\section*{Demographics}

\section*{Assumptions:}

Scenario 1:
Target Total Fertility Rate 2010-2015 and held constant for the projections period,
Target Crude Migration Rate 2010-2015 with original 2013 rates for the projections period,
Target Survival Rate distribution 2010-2015 and adjusted for improved survival for the projections period.

\section*{Scenario 2:}

Target Total Fertility Rate 2010-2015 and held constant for the projections period, Target Crude Migration Rate 2010-2015, future assumption of return to 2000 to 2005 migration rates by 2030 and held constant to 2040,
Target Survival Rate distribution 2010-2015 and adjusted for improved survival for the projections period.
Scenario 3:
Target Total Fertility Rate 2010-2015 and held constant for the projections period,
Target Crude Migration Rate 2010-2015, future assumption of return to 2000 to 2005 migration rates by 2040,
Target Survival Rate distribution 2010-2015 and adjusted for improved survival for the projections period.
Scenario 4:
Target Total Fertility Rate 2010-2015 and held constant for the projections period,
Target Crude Migration Rate 2010-2015, future assumption of return to historically highest migration rates by 2040,
Target Survival Rate distribution 2010-2015 and adjusted for improved survival for the projections period.

\section*{Scenario 5:}

Total Fertility Rate 2010-2015 and held constant for the projections period,
Target Crude Migration Rate 2010-2015 held constant throughout 2040,
Target Survival Rate distribution 2010-2015 and adjusted for improved survival for the projections period.

Total non-farm and private sector employment in New Hampshire continue a nearly steady increase from the recessionary low in early 2010. Preliminary March 2015 to March 2016 total non-farm employment increased by 10,500 jobs and represents an increase of nearly 40,000 from March of 2010. Given the increased employment activity and the meeting discussion regarding housing supply and demand, it seems reasonable to assume a more optimistic migration scenario than what was assumed in the 2013 round of projections.

\title{
I-93 Exit 4A Supplemental Environmental Impact Statement Land Use Planner Interview Summary- Final 8/7/2016 \\ \\ Woodmont Commons
} \\ \\ Woodmont Commons
}

Following is a summary of the interview held on July 25, 2016 at the Gallagher, Callahan, and Gartrell, P.C. office in Concord. Attendees were as follows:
- Woodmont Commons Representative (Developer) - Ari Pollack of Gallagher, Callahan, and Gartrell, P.C.
- CLD Consulting Engineers - Chris Bean
- Louis Berger - Leo Tidd and Kerri Snyder
- RKG Associates - Craig Seymour

\section*{Development and Land Use}

The discussion centered on the planned development of Woodmont Commons and the Exit 4A project. The Planned Unit Development (PUD) Master Plan for Woodmont Commons approved by the Town of Londonderry in 2013 provides the overall framework for the development of the site, with additional details addressed through site plan review of specific development proposals. Currently, Phase I is currently under a design review by the Town. The Development Agreement with the Town for the entire Woodmont Commons project includes provisions for mitigation of traffic impacts for each phase (discussed below). The Developer's current expectation is a 20 -year build out for the entire development (east and west of I-93).

The PUD Master Plan includes caps on the maximum development permitted in specific areas of Woodmont Commons with and without Exit 4A. These caps were developed based on a negotiation between what the Developer and the Town. As part of these negotiations, detailed technical memoranda were produced by consultants to the Developer and the Town that helped shape the final development quantities presented in the PUD. The Exit 4A project team will request this documentation from the Town of Londonderry.

The group discussed what level of development would be likely to occur on the east side of I-93 without Exit 4A. Without Exit 4A, the development on the east side of I-93 would likely go back to a residential development model (up to 330 units as allowed by the PUD). The group agreed that the 400,000 gsf of office development potentially allowed in WC-12 without Exit 4A according to the PUD would not be likely actually occur given the amount of traffic mitigation that would be required. Instead, a more realistic No Build development scenario would be a small number of supporting commercial businesses serving the needs of the 330 residential units (such as a convenience store or pharmacy).

The current programming for the east side, which is also preferred by the Town of Londonderry, is for commercial land use accessed via Exit 4A. In the with- Exit 4A scenario, the Developer expects a mixed use build-out on the east side of I-93 to the level indicated by the caps in 2013 PUD Master Plan by 2040. In other words, the PUD caps represent a reasonable "Build" scenario for the Exit 4A project. In terms of the timing of the east-side development in the Build
scenario, no development would be expected to start until after the completion of Exit 4A (currently expected by 2022). Nothing has been pre-sold or pre-leased. If Exit 4A does not move forward, the land would be used for residential development as noted above.

Regardless of the type of development on the east side, the Developer is sensitive to the environmental features (e.g., wetlands and vernal pools) and intends to minimize potential impacts to these features.

For the west side of I-93, the Developer believes the same basic build-out by 2040 will occur with and without Exit 4A; however, as previously noted, the PUD includes slightly lower development caps on the west side without Exit 4A.

Alternative A is the preferred alignment for Woodmont Commons. Alternatives C and D would require creation of a road system to support the easterly development, and the traffic mitigation required would limit commercial development to ancillary development in support of an overall residential land use. With Exit 4A, Alternative A, subarea WC-12 (east of I-93) is desirable for a commercial/institutional campus, which would result in the creation of new jobs for the state rather than shifting jobs from elsewhere within New Hampshire. Woodmont Commons is currently considering opportunities for commercial markets that are not currently present in southern New Hampshire.

\section*{Transportation}

The Development Agreement with the Town of Londonderry contains provisions for transportation improvements to support Phase I and II of the Woodmont Commons development. The approval process for these phases and future phases includes provisions for traffic studies and requires mitigation based on those studies to support the traffic generated from the development. NHDOT weighs in on improvements of state facilities (e.g., Route 102); however, the primary coordination of transportation mitigation is with the Town. Although NHDOT does not have a site approval mechanism, per se, it does approve driveway access from state facilities.

Subject: Market Basket Redevelopment - Summary

Ari,
Thank you for your time today in talking about the Market Basket Redevelopment Area. Following is a summary of our conversation.

The Market Basket Redevelopment area, owned by DeMoulas Super Markets Inc., is part of the Woodmont Commons Subarea WC-1GL. The new Market Basket was built on the other side of the plaza (in WC-1GL) in 2011. The redevelopment of the original Market Basket and associated retail area included the demolition of approximately 74,000 GSF of commercial space and the construction of approximately 42,000 GSF of commercial space. The construction is complete, and as of May

2016, the area was occupied completely by a state liquor store, card shop, TJMaxx, and Marshalls Home Goods.

In addition, there are four pads available for development within WC-1GL, also owned by DeMoulas. These pads are located along the roadway running through the Woodmont Commons development area connecting Garden Lane and Pillsbury Road.

DeMoulas is currently looking for potential tenants and has received interest from multiple parties. The development of these parcels would occur with or without the Exit 4A project. At this time, it is not possible to determine the GSF associated with these four pads, as the types of tenants and buildings that would be constructed are unknown.

I appreciate your review of the summary. Your comments are appreciated.

Regards,
Kerri

Subject: I-93 Exit 4A: Town of Auburn Land Use and Development Discussion with Bill Herman

Bill,
Thank you for your time today. Following is a summary of our discussion regarding l-93 Exit 4A and the Town of Auburn.

In the 2015 Regional Comprehensive Plan, Moving Southern New Hampshire Forward: 2015-2035, the SNHPC projects that Auburn will have a 2020 population of 5,288 and a 2040 population of 6,226 . You stated that the current population of Auburn was approximately 5,200 , so the 2020 projection may be slightly low.

In discussing the primary drivers for growth in Auburn, you stated that Auburn is largely a bedroom community with limited businesses. The Town is approximately 16,000 acres, with about a quarter of that area (approximately 4,200 acres) being the watershed for Massabesic Lake, which is the water supply for the City of Manchester. This limits the area available for development.

A primary driver of growth over the last five years has been the change in high school from Manchester to Pinkerton Academy. Auburn has a good local elementary school, and the change in high school has been viewed favorably and a selling point for homes in Auburn. The other primary driver of growth is location. Auburn is located near Exits 1 and 2 of Highway 101, and access between the town and I-93 is convenient. The majority of Auburn's population works elsewhere (Manchester and points north and south of Manchester).

Auburn has a growth management policy that has been in place for about 25 years. The growth management policy is based on the number of building permits allowed per year, and it is adjustable each year. Although the threshold to trigger the growth management policy has not been triggered, Auburn's development has been different than most of the surrounding communities. Auburn has issued about 35 new home building permits per year, and that did not change with the economic turndown in 2007-2008. The new home building permits are not for spec housing; rather they are for custom homes. The average housing price in Auburn is between \(\$ 350,000-\$ 600,000\). You mentioned that the steady increase in housing construction has not resulted in a commensurate increase in elementary school enrollment. It appears that many of the homes are built for older couples, with no children living in the home, or for families with older children, for which the Pinkerton Academy is the selling point.

Based on our discussion, the proposed Exit 4A project is not anticipated to affect development and population growth in Auburn. There may be a beneficial effect on travel time if some of the traffic on I-93 is pulled off of the interstate by Exit 4A, but it is likely that this effect would be minor. Auburn residents would not be likely to use Exit 4A to travel from l-93 to Auburn due to the convenience of access provided by Highway 101.

Any comments on the summary of our discussion are appreciated.

\section*{Regards,}

Kerri

}

Andrew,
Thank you for reviewing the summary. Following is the updated summary with your changes in red accepted.
Regards,
Kerri

In the 2015 Regional Comprehensive Plan, Moving Southern New Hampshire Forward: 2015-2035, the SNHPC projects that Chester will have a 2020 population of 5,404 and a 2040 population of 6,437 . You mentioned of not having enough knowledge to dispute those projections, however, believe those numbers to be relatively conservative and stated that Chester is currently experiencing significant growth pressure in the form of single-family residential development. Many of the subdivisions that have been dormant since the 2007-2008 economic downturn have recently restarted development. This resurgence began in Spring 2016. The primary drivers for additional residential development in Chester are good schools and the desire for rural living.

We discussed schools and population growth. Due to the very recent resurgence of residential/subdivision development, it will likely be a year or two before Chester experiences a significant increase in elementary school enrollment. At this point, it is too early in the boom cycle to say whether or not there would be a commensurate increase in school-age population/shift in demographics of the population. You would, however, expect to see an increase because most new home buyers in Chester have one or more children.

From a transportation perspective, you stated that growth in the surrounding towns (Auburn, Sandown, and Raymond) has resulted in a noticeable traffic impact to Chester roadways, specifically the intersection of NH State Routes 121 and 102. At peak rush hour (am and pm), you see significant traffic congestion on SR 121 in both directions.

We discussed the proposed Exit 4A project and whether it would have an effect on growth in Chester. Based on your experience, you believe that Exit 4A will induce additional residential growth in Chester due to improved access to I-93. However, it seems unlikely that Exit 4A would result in a measurable long-term decrease in travel time for Chester residents due to the induced development associated with the project.

Although Exit 4A would enable additional growth in Chester, the Town has a growth management provision in its zoning ordinance that would go into effect if pressure on school, fire, and police services would outstrip the Town's ability to keep pace with development. There is also an open space subdivision provision to encourage subdivisions to be creatively designed in a way that reduces sprawl and protects natural resources and rural character. The most typical type of residential development seen in Chester is still open space subdivisions, however, recently, 3 small subdivisions have applied for approval with estate size lots that allow enough space to support horses.

\section*{I-93 Exit 4A Supplemental Environmental Impact Statement \\ Land Use Planner Interview Summary - Final 02/22/17}

\section*{Town of Chester}

Following is a summary of the discussion held via telephone on January 27, 2017 between Mr. Dick Trask, Vice Chair, Chester Board of Selectmen and Kerri Snyder (Louis Berger). The purpose of the telephone call was to discuss the revision of the population projections for the Town of Chester.

Mr. Trask sent an e-mail to Leo Tidd (Louis Berger) on January 23, 2017 (Attachment A).

\section*{Building Permits}

Mr. Trask provided the following information on building permits for the Town of Chester.
Chester currently has approved or pending permits to develop about 300 lots, which are anticipated to be developed in the next 5 to 7 years (2022-2024). The 211 lots shown as currently approved and still under construction on the Town Planning Board website is correct, with regard to approved lots. \({ }^{1}\) In addition, the Town has two 30 -lot and three 5 -lot subdivisions that will be approved in the near future. One of the 30 -lot subdivisions is a Phase I - there will likely be an additional 90 lots in that 550 -acre subdivision. Table 1 shows the building permits issued since 2013.

Table 1. Chester dwelling units approved
\begin{tabular}{|c|c|}
\hline Year & Dwellings Approved \\
\hline 2013 & 30 \\
\hline 2014 & 27 \\
\hline 2015 & 30 \\
\hline 2016 & 43 \\
\hline 2017 (January only) & 12 \\
\hline
\end{tabular}

The Chester Master Plan 2015 recognizes a trend for residential growth in Chester. The plan notes that SNHPC projects that approximately 96 dwelling units would be constructed every 5 years through 2050 based on the town's historic growth rate and past building permit trends (Chester Planning Board, 2015). This projection equates to approximately 19 new home permits per year on average over a 35 -year period. However, the actual numbers for 2013-2016, as shown above, are higher. Mr. Trask stated that he believes the residential growth trend will continue to mirror the higher rate of development shown in Table 1 over the next 5 to 7 years. There was a general discussion of the previous conversation between Kerri Snyder and Andrew Hadik, Planning Coordinator for the Town of Chester (August 9, 2016). Mr. Hadik stated that many of the previously approved subdivisions had been "dormant" since the 2007-2008

\footnotetext{
\({ }^{1}\) http://www.chesternh.org/boards-committees/planning-board
}
recession, but that there had been a resurgence (Spring 2016) in development. Mr. Trask agreed with this statement and added that the number of previously approved subdivision plans that were still under construction was a combination of the effects of the recession and the rules regarding impact fees. In Chester, the developer must pay the impact fees at the time the subdivision is approved, which has led to developers applying for subdivision approval with the intention of delaying actual construction until the market is more favorable.

\section*{Population Projections}

In the August 9, 2016, interview with Mr. Hadik, he indicated that he thought the 2012 Southern New Hampshire Planning Commission (SNHPC) projections were too conservative (i.e. low) but stated that he did not have data at the time to dispute them due to the recent resurgence in growth. Mr. Trask asked that the population projections presented in the draft Land Use Scenarios Technical Report (December 2016) be revisited for Chester in light of the Town's building permit data. The population projections presented in the Land Use Scenarios Technical Report were the 2016 projections developed by NH Office of Energy and Planning (OEP).

Mr. Trask provided information based on a 1:1 dwelling unit to household ratio and estimated household size based on the average number of bedrooms proposed for each of the approved or pending subdivision permits, which yielded a household size of 3 . Table 2 includes the population and households for 2014 and 2016 provided in Attachment A and a comparison of the estimated population and households based on the SNHPC occupancy rate (0.96) and OEP household size (3.01). There was an additional adjustment made by SNHPC to increase the revised population number of 4,879 to match the OEP projection of 4,887 to suit the previously run 2015 traffic model - an increase of 8 people. The third-quarter 2016 number was used for the end of 2016. The average annual growth rate of \(3.28 \%\) is not anticipated to hold as a longer-term trend. For example, the population measured by the U.S. Census Bureau in 2010 was 4,768 . The average annual growth rate between 2010 and 2014 (estimate - 5,101) was \(1.70 \%\).

Table 2. Chester 2014 and 2016 population and household estimates
\begin{tabular}{|c|c|c|c|c|c|}
\hline \multirow{2}{*}{} & \multicolumn{2}{|c|}{2014} & \multicolumn{2}{c|}{ 2016 } & \begin{tabular}{c} 
Average \\
Annual
\end{tabular} \\
\cline { 2 - 5 } & Households & Population & Households & Population & \begin{tabular}{c} 
Annwth Rate \\
2014-2016
\end{tabular} \\
\hline Attachment A & 1,635 & 4,905 & 1,744 & 5,232 & \(3.28 \%\) \\
\hline Revised & 1,570 & 4,724 & 1,674 & 5,039 & \(3.28 \%\) \\
\hline
\end{tabular}

Based on the assumption that the 300 lots are developed by 2023, the Town projects about 2,000 dwelling units (total). Using the SNHPC occupancy rate and OEP household size yields a population projection of 5,779 by 2023 (middle ground in the 5 - to 7 -year building projection). Based on this projection, the average annual growth rate from 2015 to 2023 is 2.12\%.

Table 3 presents the revised population projections for the Town of Chester along with the 2016 OEP projections and 2012 SNHPC projections. Mr. Trask agreed that it was reasonable to apply the average annual growth rate for background population growth from 2015 to 2023 (2.12\%)
through the 2025 projection. Looking at 1990-2000 and 2000-2010, the average annual growth rates were \(3.49 \%\) and \(2.32 \%\), respectively for Chester, and these growth rates were higher than the other towns in the study area (see Table 1 in the Land Use Scenarios Technical Report). In addition, the Town of Chester has more available land for development than Derry or Londonderry. Mr. Trask indicated that the Town would like to encourage more senior housing in Chester to alleviate the potential burden on schools and other public services. The Town has growth management and open space provisions in its zoning ordinance. The growth management provision would go into effect if the development pressure on school, fire, and police services exceeds the Town's ability to serve its existing and future populations. The open space provision encourages subdivisions to be designed in a way that reduces sprawl and protects natural resources and rural character. In addition, all of the residential developments in Chester use septic systems, which limits the density of development.

Mr. Trask agreed that under the No Build condition, the Town's rate of development beyond 2025 would likely decrease. As a result, the population projections from 2025 through 2040 used the average annual growth rate projected by OEP. The average annual growth rate for Chester projected by OEP from 2025 to 2040 is \(0.25 \%\). The adjusted Town 2040 population projection is \(8.9 \%\) greater than that projected by OEP in 2016 (and presented in the Draft Land Use Scenarios Technical Report) and 2.9\% less than that projected by SNHPC in 2012.

Table 3. Adjusted No Build population projections, Town of Chester
\begin{tabular}{|c|c|c|c|c|c|c|c|}

\hline
\end{tabular}

Notes:
a. 2015 estimate for adjusted Town is based on the OEP estimate pursuant to a request by SNHPC.
b. 2015 estimate for OEP and SNHPC were generated by the respective agencies.
c. 2020 is based on interpolation between 2015 and 2025 .
d. 2025 is based on applying the 2.12\% average annual growth rate derived from the 2015-2023 projections. The 2023 projection \((5,779)\) is based on estimated 2,000 dwellings and the SNHPC occupancy rate (0.96) and household size (3.01).

\section*{Incremental Impact of the Proposed Project (Exit 4A)}

Mr. Trask stated that the primary drivers for residential growth in Chester are access to Pinkerton Academy and the availability of new homes. Mr. Trask agreed that the incremental impact of Exit 4A on residential development would be similar to that described in the draft Land Use Scenarios Technical Report (December 2016) in that the Town of Chester would reach the 2040 population projection earlier under the Build condition than it would under the No Build
condition. Mr. Trask stated that the incremental impact of Exit 4A would be similar to what would be anticipated under the high growth impact scenario as outlined in the draft Land Use Scenarios Technical Report. It was agreed that the incremental impact for the Town of Chester would use the high growth scenario with the updated population projections. Table 4 presents a comparison of the No Build and both the moderate growth and high growth impact scenario populations for Chester. These moderate and high impact growth scenarios assume the same average annual growth rate within the 5 -year increments of \(1.24 \%\) and \(1.66 \%\), respectively. Based on the assertion that the incremental impact of the proposed Exit 4A project would be similar to the high growth impact scenario, there are projected to be 1,117 additional people in Chester in 2040 as a result of the proposed project. Using the average household size for Chester (3.01), the additional people yield approximately 371 additional households in 2040 for Chester.

Table 4. Chester 2040 Build condition population growth

}

Mark,
Thank you for reviewing the summary. Following is the updated summary with your changes in bold accepted.
Regards,
Kerri

The current OEP projections show a 2020 population of 6,754 and a 2040 population of 7,070 for Sandown. We discussed historic development trends, specifically Sandown's rapid growth since the 1980s. The primary driver for growth in Sandown is affordable housing - the bulk of housing in Sandown would be considered starter homes with regard to price and size. In addition, access to I-495 and an increase in people who work from home have led to an increase in residential development in Sandown. There was a major influx of people moving to Sandown during the 1990s until the economic downturn in 2007-2008. Sandown has recently seen a resurgence (2016) in development - a 50 -unit apartment building was recently approved, and two developments that were initially planned as \(55+\) are now being developed as any age.

Although Sandown has had growth management ordinances in the past, they no longer have them due to lawsuits by developers. Sandown is now focused on buying and conserving land to reduce the available developable land in the town.
For example, Sandown purchased 200 acres for conserved Open Space that had been approved for \(15455+\) dwellings resulting in a reduction of housing potential in Sandown. The Planning Board is considering applying for another CTAP grant to acquire and conserve more land. Most of the larger tracts have been developed, and Sandown has only a couple of 100 acre tracts left that could be developed as larger subdivisions.

Sandown has a lot of wetlands and rivers, and in addition to purchasing land to conserve, the town has a vernal pool protection provision in its zoning ordinance that includes a 25 -foot buffer around vernal pools and a building setback requirement of 50 feet. In addition, the Planning Board has passed variable road width and stormwater regulations to reduce impervious surface and to promote Low Impact Development. The conservation measures improve the quality of natural resources and allow the town to reduce the amount of development and the associated increase in school enrollment.

We discussed the widening of l-93, and you stated that it is having a major effect on growth in Sandown by reducing travel times on I-93, which makes Sandown more attractive for young homebuyers. You stated that the proposed Exit 4A would be anticipated to induce additional residential development in Sandown by providing better access and reduced travel time to l-93.

Subject: I-93 Exit 4A: Town of Sandown Land Use and Development Discussion with Mark Traeger

Mark,
Thank you for your time in talking with me today. Following is a summary of our conversation as it relates to Sandown and the proposed I-93 Exit 4A.

The current OEP projections show a 2020 population of 6,754 and a 2040 population of 7,070 for Sandown. We discussed historic development trends, specifically Sandown's rapid growth since the 1980s. The primary driver for growth in Sandown is affordable housing - the bulk of housing in Sandown would be considered starter homes with regard to price and size. In addition, access to l-495 and an increase in people who work from home have led to an increase in residential development in Sandown. There was a major influx of people moving to Sandown during the 1990s until the economic downturn in 2007-2008. Sandown has recently seen a resurgence (2016) in development - a 50-unit apartment building was recently approved, and two developments that were initially planned as 55+ are now being developed as any age.

Although Sandown has had growth management ordinances in the past, they no longer have them due to lawsuits by developers. Sandown is now focused on buying and conserving land to reduce the available developable land in the town.
For example, Sandown purchased 200 acres for conserved Open Space that had been approved for 154 55+ dwellings resulting in a reduction of housing potential in Sandown. The Planning Board is considering applying for another CTAP grant to acquire and conserve more land. Most of the larger tracts have been developed, and Sandown has only a couple of 100 acre tracts left that could be developed as larger subdivisions.

Sandown has a lot of wetlands and rivers, and in addition to purchasing land to conserve, the town has a vernal pool protection provision in its zoning ordinance that includes a 25 -foot buffer around vernal pools and a building setback requirement of 50 feet. In addition, the Planning Board has passed variable road width and stormwater regulations to reduce impervious surface and to promote Low Impact Development. The conservation measures improve the quality of natural resources and allow the town to reduce the amount of development and the associated increase in school enrollment.

We discussed the widening of I-93, and you stated that it is having a major effect on growth in Sandown by reducing travel times on I-93, which makes Sandown more attractive for young homebuyers. You stated that the proposed Exit 4A would be anticipated to induce additional residential development in Sandown by providing better access and reduced travel time to l-93.

Any comments you may have on the summary of our discussion are appreciated.

Julie,
Following are the revised numbers for Chester based on your preference to use OEP's 2015 projection.
\begin{tabular}{ll}
2015 & 4,887 \\
2020 & 5,457 \\
2025 & 6,027 \\
2030 & 6,101 \\
2035 & 6,177 \\
2040 & 6,253
\end{tabular}

Please send me the TAZ breakdown for the population when you have allocated it.

Regards,
Kerri

\section*{TO:}

FROM: Julie Chen, Ph.D., Sr. Transportation Planner, Southern New Hampshire Planning Commission (SNHPC), 669-4664, jchen@SNHPC.org

DATE: \(\quad\) October 20,2016 JC

\section*{RE: \\ 2015-2040 Population Distribution to TAZs and Numbers of Households} Calculation

\section*{Population Projections Distribution}

The population projections from 2015 through 2040 for each community in the region were downloaded from the New Hampshire Office of Energy and Planning (NHOEP) website: http://www.nh.gov/oep/data-center/documents/2016-subcounty-projections-final-report.pdf.

To distribute population changes in five-year increments to TAZs, SNHPC dwelling unit projections adjusted based on 2015 dwelling unit estimates were used. There are two conditions considered as population projections for each community within the region were allocated to TAZs: 1) population increase in a five-year period; 2) Population decrease in a five-year period.

\section*{Condition one}

When the population increases during a five-year period, the allocation is calculated using the following formula.
\[
\Delta \boldsymbol{P}_{T A Z}=\frac{\Delta \boldsymbol{P}_{\text {com }}}{\Delta \boldsymbol{D}_{\text {com }}} * \Delta \boldsymbol{D}_{T A Z}
\]

Where:
\(\Delta P_{T A Z}=\) population change in a TAZ during a five-year period
\(\Delta P_{\text {com }}=\) Population change in the community in which the TAZ located during the fiveyear period
\(\Delta D_{T A Z}=\) Dwelling units change in a TAZ during the five-year period
\(\Delta D_{\text {com }}=\) Dwelling units change in the community in which the TAZ located during the five-year period

\section*{Condition two}

When the population decreases during a five-year period, the allocation is calculated using the following formula.
\[
\Delta \boldsymbol{P}_{T A Z}=\Delta \boldsymbol{P}_{D W T A Z}+\left(\Delta \boldsymbol{P}_{c o m}-\Delta \boldsymbol{P}_{D W c o m}\right) * \frac{\boldsymbol{D}_{T A Z}}{\boldsymbol{D}_{\text {com }}}
\]

Where:
\(\Delta P_{T A Z}=\) Population change in a TAZ during a five-year period
\(\Delta P_{D W T A Z}=H H S_{2015 T A Z} * \Delta D_{T A Z}=\) Assume that population change in a TAZ during a five-year period due to dwelling units change
\(H H S_{2015 T A Z}=2015\) household size within the TAZ
\(\Delta P_{\text {com }}=\) Increase of population in the community in which the TAZ located during the 5-year period
\(\Delta P_{\text {com }}=\sum \Delta P_{T A Z}=\) Population change in the community in which the TAZ located during the five-year period due to dwelling units change
\(D_{T A Z}=\) Dwelling units in the TAZ at the end of the five-year period
\(D_{D W c o m}\)
\(=\) Dwelling units in the cummunity in which the TAZ located at end of the five
- year period

Population within a TAZ at end of a five-year period was calculated as follows.
\[
P_{T A Z}=P_{T A Z-1}+\Delta P_{T A Z}
\]

Where:
\(\mathrm{P}_{\mathrm{TAZ}}=\) Population in the TAZ at end of the five-year period \(\mathrm{P}_{\mathrm{TAZ-1}}=\) Population in the TAZ at end of the prior five-year period

\section*{Number of Household Calculation}

Numbers of households for TAZs were calculated using the following formula.
\[
H H_{T A Z}=\left(P_{T A Z}-P_{\text {specialtAZ }}\right) / H H S_{2015}
\]

Where:
\(H H_{T A Z}=\) Number of households in a TAZ
\(P_{\text {specialtaZ }}=\) Special population in the TAZ
\(H H S_{2015 T A Z}=\) Household size in the TAZ

RE: I-93 Exit 4A: Data for Average Household Size \\
Date: & Tuesday, August 23, 2016 1:16:57 PM \\
Attachments: & Special population.x|sx
\end{tabular}

Hi Kerri:

I calculated household size based on population, housing units, and occupancy rate (2010). The equation is as follow.

Household size= (Population - special population)/(housing units*occupancy rate)
Occupancy rate(2010)=2010 housing units/2010 household

Attached please find special population data I used.

If you have any questions, please let me know.

Julie Chen

Subject: I-93 Exit 4A: Data for Average Household Size

Julie,
To follow up on my call/message for you this morning, I wanted to get your input what data you used for average household size in the 2015 population and household updates. The travel demand model methodology appears to have used U.S. Census household size (from 2010). Did you use the U.S. Census household size for your 2015 data? If so, did you use the Town-level or more detailed level (e.g., census block group)? If not, more detailed information on what was used is appreciated. We want to make sure we are consistent with your analysis.

Regards,
Kerri

Southern New Hampshire Planning Commission

\section*{MEMORANDUM}

TO: File

FROM: Julie Chen, Ph.D., Sr. Transportation Planner, Southern New Hampshire Planning Commission, 669-4664, jchen@SNHPC.org

DATE: \(\quad\) November 4, 2016
RE: \(\quad 2015-2040\) - Employment Projection for I-93 Exit 4A project
In order to reflect changes in employment between 2010 and 2015, the original SNHPC employment projection for 2010 through 2040 (completed in 2012) was adjusted for 2020 through 2040 projection. Three steps are followed in calculating 2015-2040 employment projection.

\section*{Step 1: Growth rates}

The study assumes that employment growth rates by employment category group for 2015-2040 were kept the same as the 2012 Southern NH Planning Commission employment projection for 2010-2040 which were reviewed by corresponding communities in the region. The following formula was used in calculating growth rates over a five-year interval.
\[
G R_{\text {Com EC } i}=\left(E_{2012 \text { Com EC } i}-E_{2012 \text { Com EC } i-1}\right) / E_{2012 \text { Com EC } i-1}
\]

Where:
\(i\) =projection years 2015, 2020, 2025, 2030, 2035 and 2040
\(G R_{\text {Com EC } i}=\) Growth rate by employment category group over i to i-1 five-year interval \(E_{2012 \text { com EC } i}=\) Total employment for an employment category group in a community
at projection year i in 2012 projection
\(E_{2012 \text { com EC } i-1}=\) Total employment for the employment category group in community at projection year i-1 in 2012 projection

\section*{Step 2: Total employment projection for an employment category group in a community 2020 through 2040}

The 2015 total employment estimate for an employment category group in a community was considered as base, total employment projections for the employment category group in the community 2020 through 2040 were calculated as follows:
\[
E_{2016 \text { Com EC } i}=E_{2016 \text { Com EC } i-1} *\left(1+G R_{\text {Com EC } i}\right)
\]

Where:
\(i\) =projection years 2020,2025,2030,2035 and 2040 \(E_{2016 \text { com EC } i}=\) Total employment for an employment category group in the community at projection year i in the 2016 projection \(E_{2016 \text { com EC } \text { i-1 }}=\) Total employment for the employment category group in the community at projection year i-1 in the 2016 projection

Step 3: Total employment for an employment category group in the community for 20202040 projection distributed to TAZs

Two conditions were used as total projected employment for an employment category group in the community was allocated into TAZs.

\section*{Condition one}

When developable land for a land use category is available and appropriate to use in a community, employment is distributed based on percentage of developable land in a TAZ in total of developable land in the community.
\[
E_{2016 \text { TAZ EC } i}=E_{2016 \text { TAZEC } i-1}+\left(E_{2016 \text { Com EC } i}-E_{2016 \text { Com EC } i-1}\right) * \text { Percentage }
\]

Where:
\(E_{2016 \text { TAZ EC } i}=2016\) Employment projection in a TAZ for an employment category group at projection year i
\(E_{2016 \text { TAZ EC } \text { i-1 }}=2016\) Employment projection in a TAZ for the employment category group at projection year i-1 in the 2016 projection
\(E_{2016 \text { com EC } i}=\) Total employment for the employment category group in the community at projection year i in the 2016 projection
\(E_{2016 \text { com EC i-1 }}=\) Total employment for the employment category group in the community at projection year i-1 in the 2016 projection

\section*{Condition two}

When developable land for the land use category is not available or not appropriate to use in a community, employment in a TAZ is calculated using same growth rate as that of employment of the employment category.
\[
E_{2016 T A Z E C i}=E_{2016 T A Z E C i-1} *\left(1+G R_{2016 \text { Com EC } i}\right)
\]

Where:
\(E_{2016 T A Z E C i}=2016\) Employment projection in a TAZ for an employment category group at projection year i
\(E_{2016 \text { TAZ EC } i-1}=2016\) Employment projection in a TAZ for the employment category group at projection year i-1 in the 2016 projection

Preparer's note: Employment data were provided on November 7, 2016. Pursuant to an agreement signed with NHDOT and SNHPC, the raw data are not available for public distribution.

APPENDIX C: MEMORANDUM: REVIEW OF EMPLOYMENT PROJECTIONS

This page intentionally left blank.

\section*{Memorandum}

DATE:
November 23, 2016
TO:
File

FROM:
Gabor Debreczeni

SUBJECT: I-93 Exit 4A: Review of Employment Projections

\section*{Introduction}

This memo is a brief evaluation of employment projections by the Southem New Hampshire Planning Commission for the towns of Aubum, Chester, Demy, Londondemy, and Sandown, all in Rockingham C ounty, through 2040.

\section*{SNHPC Projections}

The table below shows SNHPC's projection for the annual growth rate of employment from 2015 to 2040 for each of the five towns as well as for the collective study a rea. These projections were calculated from two inputs: historical growth rates for 1990-2010 (sourced from the New Hampshire Economic and Labor Market Information Bureau, NHELMIB), and a ten-year (2008-2018) employment projection by NHELMIB.

Table 1: Study Area Employment Growth Projection by Town
\begin{tabular}{|l|c|}
\hline Area & CAGR, 2015-40 \\
\hline Derry & \(0.90 \%\) \\
Londonderry & \(0.84 \%\) \\
Auburn & \(1.63 \%\) \\
Chester & \(2.24 \%\) \\
Sandown & \(0.99 \%\) \\
\hline Total Study Area & \(0.95 \%\) \\
\hline
\end{tabular}

\section*{Review of Historic al Trends}

Historical data for employment (defined by location of work rather than location of residence) and population growth from the U.S. Census Bureau \({ }^{1}\) was reviewed by Louis Berger for 2003-2014, the time range for which data was available at the town level. The table below shows the a nnual growth rate of employment for this period for the five towns, the study a rea, Rockingham County, and New Hampshire.

Historical data was also reviewed from Woods \& Poole, a firm specializing in countylevel economic projections. Employment data from Woods \& Poole measures the number of full- and part-time jobs by location of work.

Table 2: Employment Growth History
\begin{tabular}{|l|c|c|c|}
\hline Area & \begin{tabular}{c} 
U.S. Census Bureau \\
CAGR, 2003-14
\end{tabular} & \begin{tabular}{c} 
Woods \& Poole \\
CAGR, 2003-14
\end{tabular} & \begin{tabular}{c} 
Woods \& Poole \\
CAGR, 1969-2015
\end{tabular} \\
\hline Derry & \(0.53 \%\) & & \\
Londonderry & \(0.61 \%\) & & \\
Auburn & \(1.90 \%\) & & \\
Chester & \(-0.80 \%\) & & \\
Sandown & \(4.09 \%\) & & \\
\hline Total Study Area & \(0.67 \%\) & & \\
\hline Rockingham Co. & \(0.65 \%\) & \(0.96 \%\) & \(2.08 \%\) \\
New Hampshire & \(0.54 \%\) & \(0.54 \%\) & \\
\hline
\end{tabular}

The chart below shows the share of Rockingham County employment (place-of-work) that is located within the study area, for the 2003-14 period. As can be seen, the share varies from \(18 \%\) to just over \(19 \%\), but there is no clear trend of rising or declining share over time.

Figure 1: Study Area Employment as a Proportion of County Employment

\footnotetext{
\({ }^{1}\) Specific ally, the employment data was collected from the Longitudinal Employer-Household Dynamics section (http://onthemap.ces.census.gov/), while population data wascollected from the American FactFinder section (http://factfinder.census.gov/) and the City and Town Intercensal Estimates section (https://www.c ensus.gov/popest/data/interc ensal/cities/ cities2010.html).
}

The charts below show the pattems of employment as implied by historical data sourced from the U.S. Census Bureau as well as SNHPC's projected growth rates through 2040, for each of the five towns in the study area. A comparable chart for the entire study area is at the end of this document.

Figure 2: Aubum Employment History and Projection

Figure 3: Sandown Employment History and Projection

Figure 4: Londondemy Employment History and Projection

Figure 5: Deny Employment History and Projection

Figure 6: Chester Employment History and Projection

Overall the trajectory of projected employment is generally consistent with past pattems of growth in each town, with future growth rates at or below the linear trend in employment growth from 2003 to 2015.

The downward trend in employment in Chester as of 2012 is ascribed in the Land Use Scenarios Technical Report to the closing of Chester College, which is expected to reopen as a new education institution in 2020.

In Demy, the growth projection is somewhat higher than the linear trend of employment growth since 2003, but consistent with the rate of growth seen in employment following the recovery from the recession in 2011.

\section*{Historic al Models for Employment within Study Area}

To further assess the reasonableness of the regional employment growth projection, we conducted an evaluation of the historical relationship of employment growth in the study area to employment growth in the county and state as a whole. As a benchmark we also obtained an independent projection of county and state level employment through 2040.

Using the 2003-14 U.S. Census Bureau data referenced above, we developed simple regression models to investigate relationships between growth rates in employment in the study area, population in the study area, employment in Rockingham County, and employment in New Hampshire. Two models were found to have the most predictive power - one relating study area employment to county-level employment, and a
second relating it to county-level employment and study a rea population.

The tables below show information about the regression models. The logarithm of both the input and output data were taken for both regression models.

\section*{Table 3: Regression Model 1: Regional Employment as a Function of} County Employment
```

Ca11:
1m(formula = Com_Emp ~ Roc_Emp, data = log_added_data)
Residuals:
Min
Coefficients:
Estimate std. Error t value Pr (>|t|)
(Intercept) -0.1689 2.9563 -0.057 0.95556
ROC_Emp 0.8717 0.2494 3.496 0.00577 **
signif. codes: 0 '***' 0.001 '**' 0.01 '*' 0.05 '.' 0.1 ' '1
Residual standard error: 0.01802 on 10 degrees of freedom
Multiple R-squared: 0.5499, Adjusted R-squared: 0.5049
F-statistic: 12.22 on 1 and 10 DF, p-value: 0.00577

```

The first regression model indicates that regional employment levels are closely correlated with the overall level of employment in Rockingham County. The model indicates that annual growth in employment at the county level at a rate of \(1.00 \%\) can be expected to result in regional employment growth at a rate of \(0.87 \%\).

\section*{Table 4: Regression Model 2: Regional Employment as a Function of County Employment and Regional Population}
```

cal1:
1m(formula = Com_Emp ~ Roc_Emp + Com_Pop, data = log_added_data)
Residuals:
Min
Coefficients:
Estimate std. Error t value Pr (>|t|)
(Intercept) -17.4068 10.0300
Roc_Emp
llllll
Signif. codes: 0 '***, 0.001 '**, 0.01 '*, 0.05 '.' 0.1 ', 1
Residual standard error: 0.01632 on 9 degrees of freedom
Multiple R-squared: 0.6674, Adjusted R-squared: 0.5935
F-statistic: 9.032 on 2 and 9 DF, p-value: 0.007053

```

The second regression model indicates that regional employment levels are closely correlated with the overall level of employment in Rockingham County along with the level of population in the region. This model indicates that employment in the region can be expected to grow at a rate of 0.57 times the rate of county employment growth and 1.86 times the rate of regional population growth.

\section*{Other Benchmark Employment Projections}

As shown in the table below, for the 2015-40 period, Woods \& Poole projects a yearly growth rate of approximately \(1.1 \%\) for both New Hampshire and Rockingham County, which is the smallest geographical area relevant to this memo that is projected by Woods \& Poole. (As a point of comparison, Woods \& Poole projects an annual population growth rate of \(0.69 \%\) for New Hampshire and \(0.85 \%\) for Rockingham County during this time period.)

Table 5: Woods \& Poole Employment Projection
\begin{tabular}{|l|c|}
\hline Area & CAGR, 2015-40 \\
\hline Rockingham Co. & \(1.07 \%\) \\
New Hampshire & \(1.06 \%\) \\
\hline
\end{tabular}

Using the Woods \& Poole projections as an input, the Regression Model 1 (considering only Rockingham County employment as an input) would suggest an average growth rate of \(\mathbf{0 . 9 3 \%}\) per year through 2040 ( \(1.07 \% * 0.87=0.93 \%\) ).

Regression Model 2 considers both Rockingham County employment and study area population as inputs. The latter is the Office of Energy and Planning (OEP) population projection, which indicates that Rockingham County is estimated to have an annual growth rate of \(0.26 \%\) through 2040 . As such, this model predicts an employment growth rate of 1.09\% per year through 2040 ( \(0.26 \% * 1.86+1.07 \% * 0.57\) ).

\section*{Conclusion}

SNHPC's projection for employment growth in the study area appears to be reasonable. The projected growth rate through 2040 aligns with Woods \& Poole's projection for employment growth in Rockingham County, a nd both regression models suggest study area employment growth rates that are comparable to the rate of growth implied by the SNHPC projection, as shown in Table 6, below.

Table 6: Study Area Employment Growth Rate Comparison
\begin{tabular}{|c|cccc|}
\hline & SHNPC & Model \#1 & Model \#2 & \begin{tabular}{c} 
Woods \& Poole \\
(Rockingham Co.)
\end{tabular} \\
\hline 2015-40 Employment CAGR & \(0.95 \%\) & \(0.93 \%\) & \(1.09 \%\) & \(1.07 \%\) \\
\hline
\end{tabular}

While it is notable that the study area employment growth rate is forecasted to be substantially greater than the study a rea population growth rate (which is pegged at a CAGR of \(0.26 \%\) ), a third regression model attempting to predict study a rea employment by using only study area population as an input showed that for each \(1 \%\) increase in population, we would expecta \(3.1 \%\) increase in employment.

The chart below shows the pattems of study area employment based on historical place of work employment as reported by the U.S. Census Bureau; and four projections through 2040 based on growth rates from sources discussed in this memorandum: the SNHPC projection, the two regression models described above, and Woods \& Poole projections for Roc kingha m County.

\subsection*{1.0 INTRODUCTION}

The objective of this Interchange Justification Report (IJR) is to provide the necessary background for justifying the addition of a new interchange along Interstate 93 (I-93) between Exit 4 and Exit 5 in the Town of Londonderry, New Hampshire. The information included within this document will help determine if the proposed interchange improvements satisfy the Federal Highway Administration's (FHWA) two policy requirements that were developed to aid compliance with Title 23, United States Code, Highways Section 111 (23 United States Code [U.S.C.] 111), which requires all interstate construction projects to not add any points of access or exit from the project without prior FHWA approval. The FHWA Division office has been delegated approval authority for new Interstate access points involving freeway to crossroad interchanges. FHWA Headquarters approval is not required.
The two specific requirements that must be met to receive approval for the development of new or revised interstate access points are described in FHWA's May 2017 Policy on Access to the Interstate System (FHWA, 2017a). The intent of this policy is to "preserve and enhance the Interstate System to meet the needs of the 21st Century by assuring that it provides the highest level of service in terms of safety and mobility" (FHWA, 2017a).
Section 8, Policy Analysis, of this document describes the FHWA interstate access policy requirements and describes how the proposed changes at the new I-93 service interchange would fulfill them.

\subsection*{1.1 Project Description}

The proposed Project consists of a new, diamond interchange on I-93 in the Town of Londonderry, New Hampshire, between Exit 4 and Exit 5 (Figure 1-1). A connector roadway would be built on a new alignment from the new interchange to the east toward State Route 28 (NH 28) with a connection to State Route 102 (NH 102) at the east side of Derry following upgraded existing roadways, creating new roadways, or a mixture of both improvement types, depending on the alternative. Section 6.0 describes the four proposed alternatives.
Concurrently with this IJR, FHWA, NHDOT and the Towns of Londonderry and Derry are preparing a Supplemental Draft Environmental Impact Statement (SDEIS) for the Project under the National Environmental Policy Act.

Figure 1-1. Regional map

\subsection*{1.2 Purpose and Need}

The purpose and need for the project was identified early in project planning taking into consideration agency and public input. As noted in the SDEIS Appendix A, for purposes of meeting the guidelines of the U.S. Army Corps of Engineers (USACE) Highway Methodology (USACE, 1993), the basic purpose of the project is: to reduce congestion and improve safety along NH 102 from I-93 easterly through downtown Derry, and to promote economic vitality in the Derry-Londonderry area. This project purpose statement was used throughout the planning process for the identification, evaluation, and screening of potential alternatives (CLD, 2000; CLD, 2001).

\subsection*{1.2.1 Purpose}

The purpose of this project includes:
- providing for the safe and efficient movement of people, goods, and services between I93 and the towns served by NH 102, specifically Derry and Londonderry, that are immediately adjacent to I-93 Exit 4;
- providing an alternative route to the Interstate system for traffic using NH 102 to and from the east, thus removing a large volume of through traffic from the heavily congested downtown Derry street network;
- providing improved Interstate access for commercial and industrially-zoned lands near NH 28 in both Derry and Londonderry, thus allowing for the planned and orderly development of such lands to further locally-defined economic development goals and tax base diversification; and
- enhancing and promoting the economic vitality of the downtown Derry area, presently characterized by traffic congestion and decreasing vehicular and pedestrian safety, by separating local, destination-oriented traffic from through traffic destined for the Interstate system.

\subsection*{1.2.2 Need}

The Towns of Derry and Londonderry, working with the FHWA, NHDOT, and CATF \({ }^{1}\), identified several factors demonstrating the need for transportation improvements within the study area, including traffic congestion in downtown Derry, economic vitality, and safety. Each of these aspects of the need for the project is discussed below taking into account changes in traffic data and economic development opportunities since the 2007 DEIS.

\footnotetext{
\({ }^{1}\) The CATF was formed to offer opportunities for stakeholders to provide input into the project planning process. The CATF included local officials, interested citizens, and Federal and State agency staff. A list of the CATF members, and a summary of the highlights for the project meetings, including the scoping meetings, are provided in Chapter 11.
}

\section*{Traffic congestion in downtown Derry}

NH 102, known as Broadway, is the principal east-west roadway through both Derry and Londonderry and serves as the major route for traffic accessing I-93 via Exit 4. The section of NH 102 passing through downtown Derry serves as its "main street." It is currently a two-lane road from I-93 easterly through the downtown area, with several traffic signals and numerous intersections with side streets, on-street parallel parking, and a steady flow of pedestrian traffic. As a result of these complicating and often conflicting functions, downtown Derry experiences considerable congestion, as locally-oriented traffic intermingles with Interstate-bound throughtraffic. Traffic routinely backs up throughout the downtown area in the morning peak periods as the steady flow of westbound traffic from Derry tries to access the Interstate and local highway systems. In the evening peak periods, eastbound traffic on NH 102 backs up through most of the downtown area of Derry, often all the way to the I-93 Exit 4 ramps because the existing two-lane roadway and associated intersections cannot accommodate the existing traffic demands. As such, travelers attempt to find alternative routes to bypass the congestion in the downtown area, placing heavy traffic on local roads, which were not designed to have capacity for it, contributing to safety concerns in neighborhoods, and adding congestion to local roads and intersections.

The 2010 Derry Master Plan notes "The town is also continuing to pursue the I-93 Exit 4A project which is designed to relieve traffic on NH 102 and promote the safe and efficient movement of people, goods and services. Businesses in downtown Derry will benefit from the completion of the I-93 Exit 4A project through the reduction of traffic and related congestion and improved accessibility" (Town of Derry, 2010).

Although operating near capacity, the updated traffic analyses conducted for 2015 existing conditions and the 2040 No Build condition generally show acceptable peak hour Level of Service (LOS) D at the major intersections along NH 102 through downtown Derry, including the NH 102/NH 28 (Crystal Avenue/Birch Street) intersection. Traffic volumes in downtown Derry are projected to increase be approximately 15 percent between 2015 and 2040. Larger traffic increases and higher levels of congestion (LOS E or F) are not projected for Derry because of the availability of alternate routes to disperse traffic. The existing two-lane road is not capable of handling higher volumes without traffic flow breaking down. Therefore, traffic avoids the downtown NH 102 corridor, diverting to other local roads such as Folsom Road and Londonderry Road as alternate access routes to Exit 4. This situation has been observed on Folsom Road where traffic has increased from about 8,700 to 11,768 annual average daily traffic between 1998 and 2015.

The traffic diversions to avoid NH 102 result in congestion issues in additional portions of Derry, such as the intersection of N. High Street and Ash Street Extension, which is projected to operate at LOS F in the AM and PM peak hours in 2040. As traffic diverts around NH 102 to points easterly, it increases traffic on local streets not designed for high through traffic volumes. Table 1-1 provides a summary of existing and 2040 No Build Annual Average Weekday Daily Traffic (AAWDT) along key corridors in the study area.

Table 1-1. Summary of 2015 and 2040 No Build Average Annual Weekday Traffic on NH 102 and Roadways Used to Bypass NH 102

\end{tabular}

In addition to congestion in Derry, the Exit 4 interchange is projected to experience congestion issues by 2040, even with the improvements made by the I-93 widening project and intersection spot improvements proposed by Woodmont Commons. Specifically, the following intersections in the I-93 Exit 4 area would operate at LOS E or F in the 2040 No Build:
- NH 102 \& Gilcreast Road in AM and PM Peak Hour
- NH 102 \& I-93 Exit 4 Southbound Off-Ramp in PM Peak Hour
- NH 102 \& I-93 Exit 4 Northbound On and Off-Ramp in AM and PM Peak Hour
- NH 102 \& St. Charles Street/Londonderry Road PM Peak Hour

The I-93 Exit 4 southbound off-ramp to NH 102 is also projected to operate at LOS F in the 2040 PM peak hour.

\section*{Economic vitality}

Economic development issues and opportunities in Derry and Londonderry are discussed in separate sections below. In Derry, constraints related through traffic are a concern to the accessibility of business downtown. In Londonderry, a large tract of undeveloped land on the east side of I-93 currently has poor highway access and is the subject of the Town's Woodmont Commons Planned Unit Development Master Plan to attract regionally significant business opportunities.

Derry
Economic vitality is essential for the Derry downtown area to remain the center of community activity, a clear priority identified in the Derry Master Plan. Results from the community survey conducted as part of the 2010 Master Plan show that residents of Derry support attracting new businesses and industries to Derry. New businesses with the most support were office development, light industrial, an industrial park, and downtown revitalization. One of the recommendations of the Master Plan is to "Continue to research the benefits, challenges and feasibility of Exit 4A." The Master Plan notes the following potential benefits for Derry:
- A direct access route to I-93 for commercial and industrial areas of town
- A bypass for the downtown, which will alleviate some of the current traffic problems and enhance the downtown area
- Create more connections to existing commercial and industrial areas and open them up for more development

The Master Plan acknowledges that the existing heavy traffic on NH 102 influences the quality of the downtown area and the businesses located there. Traffic congestion creates a less pedestrian-friendly downtown and likely results in some drivers seeking alternate shopping opportunities and traffic routes. The Master Plan notes several actions that could be implemented to improve conditions for pedestrians and to promote a business-friendly environment downtown. In order to be implemented, many of the actions recommended in the Derry Master Plan will require that downtown traffic congestion be alleviated. The Master Plan states that "Businesses in downtown Derry will benefit from the completion of the I-93 Exit 4A project through the reduction of traffic and related congestion and improved accessibility." Further economic benefits to both Derry and Londonderry could also be realized by providing access to the existing industrial zoned land adjacent to the east side of I-93 between Exits 4 and 5.

The Exit 4 southbound off-ramp is operating at or near capacity (LOS D) in the AM peak hour and failing (LOS F) in the PM peak hour. The northbound on- and off-ramp is operating at LOS E in the AM peak hour and LOS F in the PM peak hour. This has consequences to the economic well-being of Derry because the Exit 4 Interchange currently provides the only direct access between the Interstate and most of Derry's developed area. Although further improvements to the Exit 4 Interchange were constructed as part of the I-93 widening project, traffic congestion and associated safety issues along NH 102 in downtown Derry will continue, as described later in this IJR.

\section*{Londonderry}

There are large tracts of undeveloped land adjacent to the east side of I-93 between Exits 4 and 5, the economic value of which would be greatly enhanced by a direct connection to I-93. By providing direct access to the Interstate in this area, land value will increase as it will be better suited for larger scale commercial or industrial development. The proximity of the ManchesterBoston Regional Airport to this area also adds to the value and development potential of this land. As noted in the Land Use Scenarios Technical Report (Louis Berger, 2017), a new exit would provide accessibility to existing undeveloped land, thereby enhancing the development
potential. The net effect of these development activities would likely be a number of new, high paying jobs and increased tax revenue for both towns.

Since the 2007 DEIS, additional local planning efforts have further defined the development opportunities near I-93 in Londonderry. In 2013, the Town of Londonderry approved the Woodmont Commons Planned Unit Development Master Plan covering approximately 630 acres bordering the east and west sides of I-93. The Master Plan envisions a mixed-use urban village being developed in several phases over 20 years. Portions of development on the east side of I-93 are under construction, with completion expected in 2020 (Woodmont Commons Phase I). The Master Plan restricts the quantity of development allowed on both the east and west sides of I-93 if Exit 4A is not constructed to limit traffic impacts of development. On the east side of I-93 specifically, coordination conducted during the Exit 4A land use study found that a predominately residential development pattern would occur in a No Build scenario (approx. 330 units). The provision of new interstate access to the east side of I-93 would allow for substantially higher-intensity of development, nearly \(700,00 \mathrm{gsf}\) of commercial and \(420,00 \mathrm{gsf}\) of institutional uses based on the land use study (Woodmont Planning Team, 2011).

\subsection*{1.2.3 Safety}

Although the Exit 4 Interchange has been reconstructed to handle the projected design year traffic flows easterly into Derry as part of the I-93 widening project, the primary design intent is to address the north-south travel demands of the I-93 corridor and not the east-west demands along NH 102 in the study area. The section of NH 102 that runs easterly into downtown Derry from Exit 4 will continue to have an insufficient number of lanes, especially at the intersections, to handle the existing and future peak traffic flows. These peaks are especially high during the heavy evening commuting periods when both through traffic and traffic accessing local businesses are sharing the same roadway. Because the existing road has insufficient lanes to handle the peak traffic volumes, the traffic backs up into the Interchange area, which results in increased safety hazards for the traveling public. Several intersections with high crash rates based on analysis of 2013-2015 crash data are located along NH 102 in the study area, including at Gilcreast Road, Garden Lane/Hampton Drive and the I-93 Exit 4 Northbound Ramps.

Between 2010 and 2014, there were a total of 716 crashes in the DSEIS study area, including 240 crashes along NH 102 between Exit 4A and Tsienneto Road (NHDOT, 2010-2014). Of the total, approximately 24 percent resulted in injury or fatality. If traffic using NH 102 to the east could be moved away from the interchange area more efficiently, traffic congestion at the ramp intersections could be reduced and traffic flow improved, resulting in a more orderly and safer flow of traffic through the intersections, as well as elsewhere along NH 102.

The congestion in downtown Derry results in some vehicles seeking alternative routes, many of which result in additional traffic through residential neighborhoods, representing an additional safety concern. On Broadway itself, the congestion results in increased conflicts between through traffic, turning traffic, parked cars, pedestrians, and bicyclists.

\section*{Purpose Statement}

Provide safety improvements

Reduce traffic congestion in downtown Derry and discourage traffic from diverting from NH 102 onto local streets to avoid downtown Derry Improve economic vitality in the Towns of Derry and Londonderry

Increase Interstate access for commercial and industrial suppliers

\section*{Objectives}

Provide for the safe and efficient movement of people, goods, and services between I-93 and the towns served by NH 102, specifically Derry and Londonderry, that are immediately adjacent to I-93
Provide an alternative route to the Interstate system for traffic using NH 102 to and from the east, thus removing a large volume of through traffic from the heavily congested downtown Derry street network

Enhance and promote the economic vitality of the downtown Derry area, presently characterized by traffic congestion and decreasing vehicular and pedestrian safety, by separating local, destinationoriented traffic from through traffic destined for the Interstate system

Provide improved Interstate access for commercial and industriallyzoned lands near NH 28 in both Derry and Londonderry, thus allowing for the planned and orderly development of such lands to further locally defined economic development goals and tax base diversification

\subsection*{2.0 METHODS AND ASSUMPTIONS}

\subsection*{2.1 Documentation}

As required by New Hampshire Department of Transportation (NHDOT) and FHWA, the following two specific requirements are addressed in this document:
- Policy Requirement 1 - provides operational and collision analysis by evaluating the operation of existing interchanges in the study area for the base year (2015) and future year (2040) using the U.S. Department of Transportation’s Highway Capacity Manual (HCM) analysis and the Southern New Hampshire Planning Commission (SNHPC) to forecast future volumes.
- Policy Requirement 2 - describes access connections and design for all four traffic movements.

\subsection*{2.2 Analysis Period}

Operational analysis includes both AM and PM peak hours for the following years:
- Base Year: 2015
- Future Year: 2040

\subsection*{2.3 Study Area}

This section defines the traffic study area based on FHWA guidance and describes the data collection methods. The Project study area includes a mixture of Interstate and intersection facilities. According to FHWA guidance, when performing an IJR for a new interchange, the
closest existing interchange in each direction of a proposed new interchange must be included. In addition, the first major signalized intersections along the roadway (usually an arterial) serving the closest interchange must be included (FHWA, 2017a). To be conservative, the study includes signalized intersections within 0.5 miles of the interchange. This includes all interchange facilities such as merges, diverges, and weaves and intersections along the arterial. Based on this guidance, the Project study area includes the following:
- I-93 mainline between south of Exit 4 to north of Exit 5
- All merges and diverges at Exit 4 along I-93
- All merges and diverges at Exit 5 along I-93
- All proposed merges and diverges at the new proposed Exit 4A along I-93
- The following NH 102 intersections
o I-93 Southbound off-ramp (signalized) - ramp terminus at interchange
o I-93 Northbound off and on-ramp (signalized) - ramp termini at interchange
o Fordway/ Madden Hill Road (signalized) - approximately 2/3 mile to the east
o Londonderry Road/St. Charles Street (unsignalized) - approximately \(1 / 3\) mile to the east
o Garden Lane/Hampton Drive (signalized) - approximately \(1 / 3\) mile to the west
o Gilcreast Road (signalized) - approximately \(1 / 2\) mile to the west
- The following NH 28 Intersections
o I-93 Southbound off and on-ramp termini (signalized)
o I-93 Northbound off and on-ramp termini (signalized)
o Symmes Drive/Vista Ridge Drive (signalized) - approximately \(1 / 3\) mile to the west
o Liberty Drive (signalized) - approximately \(1 / 3\) mile to the east
Figure 2-1 shows the study area intersections.

Figure 2-1. IJR Study area intersections

\subsection*{3.0 EXISTING CONDITIONS}

The existing conditions describes the existing and future demographic forecasts, existing land use, roadway network, alternative travel modes, interchanges, traffic data sources, operational performance, and safety conditions.

\subsection*{3.1 Demographics}

A total of 84 Transportation Analysis Zones (TAZ) covering 143 square miles were used to represent the SNHPC's subarea travel demand model. The demographic values assigned to each TAZ, including population, households, and employment, are based on the report titled Land Use Scenarios Technical Report, a report prepared as part of the current I-93 Exit 4A SDEIS project. These demographic values directly influence the number of trips produced at the residence locations and number of trips attracted to work locations in the travel demand model. The model then converts these production and attraction values into the number of trips assigned from each model origin TAZ to a model destination TAZ to form an origin-destination trip table.
The process to develop the existing and future demographic values included a review of existing federal, state, and regional, and local data sources as well as interviews with planners at the state, regional, and local levels. Primary sources included the following:
- U.S. Census Bureau
- New Hampshire Office of Strategic Initiatives
- SNHPC
- Neighboring Regional Agency, Rockingham Planning Commission (RPC)
- Derry
- Londonderry
- Neighboring Communities of Auburn, Chester, and Sandown

The future demographic forecasts were developed for the No Build Condition and the Build Conditions. They rely on a review of past trends; projections at the state, regional, and local levels; an active list of planned development; and additional demographic trend information learned through the interviews.

\subsection*{3.1.1 \(\quad 2040\) No Build Condition}

Past trends evaluated demographic changes from 1990 through 2014 and focused on positive and negative patterns by municipality. Population projections have been forecasted in 5-year intervals between 2015 and 2040 by the New Hampshire Office of Energy and Planning and the municipalities; household and employment projections have been forecasted between 2010 and 2040 by SNHPC and RPC. The report synthesized the various data sources and provided future No Build Condition background demographic forecasts.
There are a number of planned developments in Londonderry, including an extensive mixed used development called Woodmont Commons. The Woodmont Commons Planned Unit
Development Master Plan includes land on both the west and east sides of I-93, as shown in Figures 3-1 and 3-2. The Woodmont Commons Phase I plan included as part of the No Build

comprises 312,574 gross square feet of commercial, 510 units residential, and 135 hotel rooms. There is also a smaller, commercial development of 30,000 gross square feet and 1,094 gross square foot of industrial development. These developments are projected to create over 4,200 jobs and add over 3,800 in population and 1,345 households to the study area (Louis Berger, 2017).

The total 2040 No Build Condition demographic forecasts were developed by adding the existing values to the forecasted background growth and planned development projections. Tables 3-1, \(3-2\), and 3-3 contain the 2040 No Build Condition population, household, and employment projections for the study area, respectively.

\subsection*{3.1.2 2040 Build Condition}

Creating a new connection from I-93 to Londonderry and Derry would provide better access to a number of parcels and could influence the type and/or intensity of future development. This development potential is referred to as indirect land use effects. The 2040 Build Condition incorporates indirect land use effects of constructing a new interchange.

In total, 398 new residential units, 200 hotel rooms, 1,015,400 gross square feet commercial, 460,000 gross square feet institutional, and 168 industrial jobs could be added as a result of the indirect land use effects of creating I-93 Exit 4A (Louis Berger, 2017). For Woodmont Commons, the developments on both sides of I-93 (referred to as full build-out) are included containing 9 residential units, 200 hotel rooms, 1,015,400 gross square feet of commercial, and 460,000 gross square feet of institutional.
Each proposed alternative assessed in this study incorporates different levels of demographic growth based on proposed transportation improvements. Each alternative and its demographic components are as follows:
- Alternative A: Woodmont Commons Full Build-out plus growth in Derry, Londonderry, Auburn, Chester, and Sandown
- Alternative B: Similar to Alternative A
- Alternative C: Woodmont Commons Phase I (same as No Build) plus growth in Chester and Sandown
- Alternative D: Similar to Alternative C
- Alternative F: Similar to the No Build Condition

The total 2040 Build Condition demographic forecasts were developed by adding the 2040 No Build values to the forecasted indirect effects of land use. Tables 3-4, 3-5, and 3-6 contain the Alternative A and B 2040 Build Condition population, household, and employment projections for the study area, respectively. Population, households, and employment are not expected to

\end{tabular}

Source: Louis Berger (2017)
Once the 2040 No Build and Build demographic values by municipality were developed, they were allocated to each TAZ representing the municipality. The anticipated population, household, and job growth associated with the known No Build developments was assigned to TAZs based on the percentage of the development land area in each TAZ. Only the TAZ that contained a proposed change in demographic data was updated. Out of the 84 TAZs, 17 TAZs were updated representing the zones in the municipalities where growth would occur based on background growth and planned development, or could occur based on indirect effects of land use. The I-93 Exit 4A SDEIS Land Use Scenarios Technical Report (Louis Berger, 2017) contains the detailed demographic data by TAZ.

\subsection*{3.2 Land Use}

In New Hampshire, land use is regulated at the local level by municipalities through zoning and subdivision regulations. Zoning ordinances regulate land uses by area and the type and form of built improvements allowed within each land use. Subdivision ordinances seek to control the density of development on new parcels of land. Land use can also be influenced by other public policy goals expressed as part of land use, transportation, and infrastructure planning processes.

Current land use and zoning conditions were identified using geographic information systems datasets of land use by tax parcel and zoning district boundaries provided by the Towns of Derry and Londonderry. In addition, the data were supplemented with reference to the towns' zoning ordinances (Town of Derry, 2016; Town of Londonderry, 2016). The land use within the study area was defined as the land area within 500 feet of the proposed alternative alignments (Figure \(3-1\) ). Field visits and windshield surveys were used to verify land use conditions.
Land use policies and plans for the Project area were identified through a review of the following comprehensive and master plans:
- Master Plan of Derry (Town of Derry, 2010)
- Comprehensive Master Plan of Londonderry (Town of Londonderry, 2013)
- Southern New Hampshire Planning Commission’s Moving Southern New Hampshire Forward: 2015-2035 Regional Comprehensive Plan (SNHPC, 2014)

Land use within the study area includes commercial, industrial, single- and multi-family residential, institutional, civic, open space, and recreational (golf course). Figure 3-1 also identifies the proposed Woodmont Commons Planned Unit Development (PUD).
The Woodmont Commons PUD is planned for construction on both the east and west sides of I-93 in Londonderry. Phase I is the only approved plan along the west side of I-93; it includes a Market Basket. Access to these parcels is available from John R. Michels Way and Pillsbury Road. Woodmont Commons East would be located north of Ash Street and directly serviced by a new I-93 Exit 4A under Alternatives A or B (See Section 6.1 for detailed alternative description). Pillsbury Road and Ash Street would provide a direct connection between the east and west sections of Woodmont Commons. Specific uses within the development have not been finalized but would include residential, office, medical, hotel, retail, and civic uses. Figure 3-2 illustrates the proposed Woodmont Commons PUD.

Figure 3-1. Land use in the study area

Figure 3-2. Proposed Woodmont Commons Planned Unit Development

\subsection*{3.3 Roadway Network}

The roadway network in the study area contains a mix of Interstate, principal arterials, collectors, and local roadways.
Interstate 93 is a north-south oriented, full access control roadway part of the Eisenhower Interstate System connecting Massachusetts to Vermont. It has a posted speed limit of 65 miles per hour (mph) through the study area and four travel lanes, two in each direction. The average daily traffic (ADT) in 2015 was approximately 35,000 vehicles in each direction or 71,000 total vehicles per day and is functionally classified by NHDOT as a principal arterial, Interstate (NHDOT, 2016a; 2017a). Two interchanges exist in the study area serving NH 102 and NH 28.
NHDOT is in the process of upgrading I-93 from four to eight lanes between Salem, New Hampshire, at the Massachusetts border and Manchester, New Hampshire, ending at Exit 6 at the I-293 interchange, more than 3 miles north of Exit 5. Exit 5 reconstruction was completed in 2014. Exit 4 reconstruction is currently ongoing with anticipated completion in fall 2020.

Widening the I-93 mainline to six lanes is currently ongoing between Exits 4 and 5 with anticipated completion in fall 2020. Final construction of the fourth lane in each direction (eight lanes total) will be achieved with a separate project in the NHDOT Ten Year Plan with anticipated completion in fall 2020 (NHDOT, 2017b). The No Build and all Build alternatives under study for Exit 4A assume completion of the I-93 widening project.
NH 28 is a north-south oriented roadway with partial access control in the vicinity of the interchange connecting Massachusetts to Manchester, New Hampshire. It has a posted speed limit of 30 mph through the study area and four travel lanes, two in each direction from the I-93 interchange and north. To the south it has two travel lanes, one in each direction. The ADT in 2014 was approximately 16,000 total vehicles per day and is functionally classified by NHDOT as an urban minor arterial (NHDOT, 2016b; 2017a).
NH 102 is a northeast-southwest oriented roadway with partial access control west of I-93 and no access control east of I-93 connecting Nashua to Chester, New Hampshire. It has a posted speed limit of 30 mph through the study area and has four travel lanes, two in each direction from the I-93 interchange and west. To the east it has two travel lanes, one in each direction. The ADT in 2014 was approximately 18,000 total vehicles per day and is functionally classified by NHDOT as an urban principal arterial - other (NHDOT, 2016c; 2017a). The roadway travels through a more urban environment to the east of I-93, entering the outskirts of downtown Derry.
Symmes Drive/Vista Ridge Drive is a north-south oriented local roadway with no access control. It has two travel lanes, one in each direction.
Liberty Drive is a north-south orientated local roadway with no access control. It has two travel lanes, one in each direction.

Gilcreast Drive is a northwest-southeast oriented local roadway with no access control. It has a posted speed limit of 35 mph through the study area and has two travel lanes, one in each direction. It is functionally classified by NHDOT as an urban major collector (NHDOT, 2016c).
Garden Lane/Hampton Drive is a northwest-southeast oriented local roadway with no access control. It has two travel lanes, one in each direction.

Londonderry Road/St. Charles Street is a northwest-southeast oriented local roadway with no access control. It has a posted speed limit of 35 mph along Londonderry Road through the study area and has two travel lanes, one in each direction.

Figure 3-3 shows the functional classification of roadways in the study area.

Figure 3-3. Functional classification of roadways in the study area

\subsection*{3.4 Alternative Travel Modes}

There are three bus routes, two park and ride lots serviced by the buses, and a bicycle trail in the study area. Figure 3-4 shows the alternative travel modes in the study area. The bus operations include Boston Express, Concord Coach Lines, and Cooperative Alliance for Regional Transportation.

Boston Express operates express bus service between Concord New Hampshire and Boston, Massachusetts. There are two bus stops in the study area composed of North Londonderry at Exit 5 off NH 28 and Londonderry at Exit 4 off NH 102. Buses either service one stop, then express to Boston during the AM peak period, but stop at both Londonderry stops on the return trip. A total of nine inbound buses operate during the AM peak period (6:00 a.m. - 9:00 a.m.) from either stop and 12 buses operate in the return direction during the PM peak period (4:00 p.m. 7:00 p.m.) (Boston Express, 2016).
Concord Coach Lines operates express bus service between northern New Hampshire and Boston, Massachusetts. There is one bus stop in the study area composed of North Londonderry at Exit 5 off NH 28. A total of six southbound buses operate over the course of the day and five northbound buses operate during the course of the day (Concord Coach Lines, 2017).
Cooperative Alliance for Regional Transportation is a specialty shuttle service that serves the study area by providing on-call rides and scheduled local shuttle routes to shopping and medical services. The routes can include deviations to accommodate patron requests (CART, n.d.).The two park and rides are located near I-93 at Exit 4 in Londonderry and Exit 5 in North Londonderry. Both are served by buses.
Londonderry Exit 4 Park and Ride is operated by Boston Express and Boston Express is the only bus that services the facility. It contains 452 parking spaces and provides a bus shelter and bicycle rack (NHGov, 2017a).
North Londonderry Park and Ride is operated by Boston Express and is served by Boston Express and Concord Coach Lines. It contains 728 parking spaces and provides a bus shelter and bicycle rack (NHGov, 2017b).
There is also a multiuse trail that traverses the study area called the Londonderry Rail Trail along the former Manchester and Lawrence Railroad. This trail is part of a larger trail initiative called the Granite State Rail Trail (Londonderry Trails, 2016).
New Hampshire does not have a high occupancy vehicle lane in the state.

\subsection*{3.5 Interchanges}

Two existing interchanges in the study area serve Exits 4 and 5 . I-93 at Exit 4 is a combination diamond interchange on the northbound side and partial cloverleaf or Parclo A on the southbound side (FHWA, 2012b). This interchange type provides a higher capacity for NH 102 in the westbound direction by allowing a free-flow move from NH 102 westbound to I-93 southbound. Exit 5 is a compressed diamond interchange, where the spacing between the two intersections at the ramp termini is less than 800 feet (FHWA, 2012b). This interchange was recently upgraded to provide partial access control along NH 28 between Liberty Drive and Symmes Drive. The distance between the two interchanges is approximately 3.6 miles.

Figure 3-4. Alternative travel modes in the study area

Figure 3-5 shows the I-93 Exit 4 and Exit 5 interchanges.

\subsection*{3.6 Existing Data}

\subsection*{3.6.1 Introduction}

The primary tool to forecast the future volumes for the proposed I-93 Exit 4A was the SNHPC's travel demand model. The model's most recent base year, 2015, was developed to only forecast daily traffic volumes, not AM or PM peak periods. Therefore, the traffic data collection effort focused on developing both a 2015 balanced AM and PM peak hour network and a daily volume network. The AM and PM peak hour networks provided the percent adjustments between the peak hour volumes and daily volumes while the daily volume network provided the model's 2015 base year data. SNHPC created a 17 TAZ subarea of the model representing Chester, Derry, and Londonderry, the project study area, and calibrated the subarea to the 2015 daily volume balanced network. Once calibrated, the model was ready to test different 2040 future I93 Exit 4A alternatives and produce the 2040 daily vehicle volumes, based on the land use growth projections. The percent vehicle adjustments between the 2015 AM and PM peak hour volumes and 2015 daily volumes provided the adjustment from the model's forecasted 2040 daily vehicle volume output and forecasted 2040 peak hour volumes. Traffic analysis tools relied on the peak hour volumes to assess the interstate facility and intersection operations.

\subsection*{3.6.2 Traffic Data Collection}

Traffic data collection focused on collecting recent data to develop a balanced 2015 network. Data were collected from five sources: (1) Project team, (2) NHDOT permanent count stations, (3) the SNHPC's NH 102 Corridor Update Study Report, (4) the I-93 Supplemental EIS (SEIS), and (5) NHDOT intersection report. The first two sources provided counts in 2016 covering the I-93 mainline and ramp volumes as well as NH 102 and NH 28 turning movement counts for intersections serving I-93 ramp termini and a few intersections east of the interchange along NH 102.

The project team collected daily and hourly ramp volumes at the following intersections in May 2016:
- I-93 northbound off-ramp to NH 102 (Exit 4)
- I-93 northbound on-ramp from NH 102 (Exit 4)
- I-93 southbound off-ramp to NH 102 (Exit 4)
- I-93 southbound on-ramp from NH 102 westbound (Exit 4)
- I-93 southbound on-ramp from NH 102 eastbound (Exit 4)
- I-93 northbound off-ramp to NH 28 (Exit 5)

Figure 3-5. I-93 Exit 4 and Exit 5 interchanges
- I-93 northbound on-ramp from NH 28 (Exit 5)
- I-93 southbound off-ramp to NH 28 (Exit 5)
- I-93 southbound on-ramp from NH 28 (Exit 5)

The project team collected AM and PM peak period turning movement counts at the follow intersections in May 2016:
- I-93 northbound on and off-ramps at NH 102 (Exit 4)
- I-93 southbound off-ramp at NH 102 (Exit 4)
- I-93 northbound on and off-ramps at NH 28 (Exit 5)
- I-93 southbound on and off-ramps at NH 28 (Exit 5)
- NH 102 at Londonderry Road/St. Charles Street
- NH 102 at Fordway/Madden Hill Road

The project team obtained hourly and daily vehicle volumes at the follow intersections from April 2014, July 2015, or September 2015:
- NH 102 east of Griffin Street (east of Exit 4)
- NH 102 east of Hampton Drive (west of Exit 4)
- NH 28 east of Perkins Road (west of Exit 5)
- NH 28 north of Liberty Drive (east of Exit 5)

NHDOT provided permanent count station hourly volume data from 2015. The following station data were collected:
- I-93 northbound and southbound, between Exits 3 and 4
- I-93 northbound and southbound mainline, between Exits 4 and 5
- I-93 northbound and southbound mainline, between Exits 5 and 6

The Woodmont Commons Phases I and II Traffic Impact Assessment (TIA) provided turning movement counts for two intersections located west of I-93 at Exit 4 (TEC, 2016). These volumes were obtained in 2016 and used to calculate the vehicle percentage for each tuning movement and applying that percentage to the balanced 2015 traffic network at Exit 4 composed of the project team traffic data. The Woodmont Commons TIA provided data on the following intersections to the study area:
- NH 102 at Gilcreast Road
- NH 102 at Garden Lane/Hampton Drive

The I-93 SEIS provided turning movement counts for one intersection located west of I-93 at Exit 5 (NHDOT, 2009). This volume was obtained in 2005 and used to calculate the vehicle percentage for each tuning movement and applying that percentage to the balanced 2015 traffic network at Exit 5 composed of the project team traffic data. The I-93 SEIS provided data on the following intersection to the study area:
- NH 28 at Symmes Drive/Vista Ridge Drive

NHDOT provided a turning movement count for one intersection located east of I-93 at Exit 5. This volume was obtained in 2005 and used to calculate the vehicle percentage for each tuning movement and applying that percentage to a combination of the balanced 2015 traffic network at Exit 5 composed of the project team traffic data and NHDOT automatic traffic recorder (ATR) data representing NH 28 north of Liberty Drive intersection. NHDOT provided data on the following intersection to the study area:
- NH 28 at Liberty Drive

Figure 3-6 shows the existing condition study area turning movement counts covering the AM and PM peak hours.

As part of the field data collected, a detailed inventory of the lane geometry was conducted through field reconnaissance and a study of aerial imagery. Based on this information, the existing lane geometry and traffic control type (signalized or unsignalized) are shown in Figure 3-7.

Figure 3-6. AM and PM 2015 existing turning movement volumes

Figure 3-7. AM and PM 2015 existing lane geometry

\subsection*{3.6.3 Traffic Data Adjustments}

The raw data from the daily counts were adjusted to create a 2015 base year balanced network using the following three processes. First, they were adjusted based on the count season to allow for seasonal traffic fluctuations and represent a more typical October or April time period. Second, the counts were adjusted to correct for the number of axles that triggered the counter to record a vehicle. Large trucks with more than two axles were counted as two or even three separate vehicles because the counter is programmed to record a vehicle every two axles that cross a sensor or tube. Third, the counts were increased or decreased following a growth factor calculated separately for I-93 mainline and all other roadways (including the I-93 ramps). The I-93 mainline applied a 1.1 percent growth per year based on comparing multiple years of data for a counter on I-93, and all other roadways applied a 2.5 percent growth per year rate based on comparing multiple years of data for a counter on NH 28. Counts were increased or decreased by the appropriate rate depending on whether the counts were before 2015 or after 2015 (no adjustment was applied to 2015 counts).

\subsection*{3.7 Operational Performance}

This operational performance explains the concepts and definitions for analyzing the traffic operations, the process used to analyze the study area intersections and freeway facilities along I93 , and the results of the traffic analyses.

\subsection*{3.7.1 Analysis Tools}

The study analyzed the study area intersections using Synchro \({ }^{\text {TM }}\) Traffic Signal Coordination Software Version 10.0 (Build 1, Revision 26). Two analyses were performed for traffic, including an intersection capacity analysis and an intersection queueing analysis. The intersection capacity analysis used the Synchro \({ }^{\text {TM }}\) software tool and various input values as described in the following sections to determine the level of service (LOS) or driver perception of an intersection's operation. The intersection queuing analysis used the Synchro \({ }^{\mathrm{TM}}\) tool to determine different levels of queuing or the length that vehicles may back up at an intersection.
The study analyzed the I-93 freeway facilities using Highway Capacity Software (HCS) 2010 (Version 6.90). Analyses were performed for ramp merge and diverge facilities. The HCS relied on various input values to determine the LOS or driver perception of a freeway segment's operation.

\subsection*{3.7.2 Intersection Operations Analysis}

LOS is the primary measure of traffic operations for both signalized and unsignalized intersections. LOS is a standard performance measure developed by the transportation profession to quantify driver perception for such elements as travel time, number of stops, total amount of stopped delay, and impediments caused by other vehicles. LOS provides a scale that is intended to match motorists' perception of how a transportation facility operates and to provide a scale to compare different facilities. Detailed LOS descriptions are presented in Figure 3-7.

\section*{Signalized Intersection Level of \\ Service}

The LOS for signalized intersections is based on the HCM 2000 method and requires the same inputs to determine an accurate LOS (TRB, 2000). HCM 2010 methods were not followed because the signal timings and phasing were not HCM 2010 compliant, for example, signal timings included pedestrian-only phases. Primary inputs include:
- vehicular volumes
- pedestrian volumes
- traffic signal timings
- roadway geometry
- speed limits
- truck percentages
- peak hour factor (measure of vehicle 15-minute flow rate)
The average vehicle control delay, measured in seconds per vehicle, is calculated using these parameters with the Synchro \({ }^{\text {TM }}\) procedures. This represents the average extra delay in seconds per vehicle caused by the presence of a traffic control device or traffic signal and includes the time required to decelerate, stop, and accelerate. The LOS can be characterized for the entire intersection, each intersection approach, and each lane group. Control delay is used to characterize the LOS for the entire intersection or an approach. The control delay and the volume-to-capacity ratio are used to characterize the LOS for a lane group. Delay quantifies the increase in travel time due to a traffic signal control. It is also a surrogate measure for driver discomfort and fuel

Figure 3-8. Level of service diagram consumption (TRB, 2010). Signalized intersections or approaches that exceed a delay of 55 seconds have LOS E and those that exceed a delay of 80 seconds have LOS F. Table 3-7 shows the average control delay and corresponding LOS for signalized intersections.

Table 3-7. Signalized intersection control delay and LOS thresholds - HCM 2000 method
\begin{tabular}{|c|c|c|}

conditions
\end{tabular} \\
\hline F & \\
\hline
\end{tabular}

Source: TRB (2000)
To determine the LOS of an intersection, the critical input values were entered into the analysis software (Synchro \({ }^{\mathrm{TM}}\) ), and the average vehicle delay (seconds per vehicle) was calculated. Based on the average vehicle delay, the LOS was determined for all movements (left, through, and right), approaches, and the intersection as a whole.

\section*{Unsignalized Intersection Levels of Service}

The LOS for unsignalized intersections (STOP-controlled intersections) is based on the HCM 2000 method to be consistent with the intersections analysis and requires several inputs, including:
- vehicular volumes
- pedestrian volumes
- roadway geometry
- speed limits
- truck percentages
- peak hour factor

The average vehicle control delay, in seconds per vehicle, was calculated using these parameters with the HCM 2000 procedures (TRB, 2010). Average vehicle control delay represents the average delay caused by the presence of a stop sign or roundabout and includes the time required to decelerate, stop, and accelerate.
The LOS for a two-way, STOP-controlled (TWSC) intersection (i.e., unsignalized intersection) is determined for each minor-street movement or shared movement and the major-street left turns. LOS F is assigned to the movement if the volume-to-capacity ratio for the movement exceeds 1.0 or if the movement's control delay exceeds 50 seconds. The criteria used to determine LOS for TWSC intersections are different from the criteria used for signalized intersections primarily because user perceptions differ among transportation facility types. The expectation is that a signalized intersection is designed to carry higher traffic volumes and presents greater delay than an unsignalized intersection. Unsignalized intersections are also
associated with more uncertainty for users because delays are less predictable than at signals, which can reduce users' delay tolerance. LOS is not defined for the TWSC intersection as a whole or for major-street approaches for three primary reasons: (1) major-street through vehicles are assumed to experience zero delay; (2) the disproportionate number of major-street through vehicles at a typical TWSC intersection skews the weighted average of all movements, resulting in a very low overall average delay for all vehicles; and (3) the resulting low delay can mask important LOS deficiencies for minor movements (TRB, 2010).

The capacity of the controlled intersection legs is based primarily on three factors: the conflicting volume, the critical gap time (defined as the number of seconds between vehicles passing the same point along the major street approach), and the follow-up time (defined as the number of seconds between the departure of the first and second vehicle in queue along the minor street approach). The HCM-based capacity analysis procedure assumes that drivers are both consistent and homogeneous and assumes consistency for their critical gap time. Critical gap times are based on many factors, including delay experienced by drivers on the approaches controlled by STOP signs. As delay increases, drivers become less patient and accept shorter gaps, resulting in higher capacities for unsignalized intersections that are operating at LOS D or worse. The unsignalized intersection procedure uses fixed critical gap times. Unless the critical gap times are adjusted, the procedure tends to overestimate the delay at unsignalized intersections that are operating at LOS D or worse. Also, poor operations at an unsignalized intersection encourages some drivers to turn right and make a U-turn on the mainline or accept shorter critical gaps (safety issue) rather than attempt a left turn (TRB, 2010).

Table 3-8 shows the average control delay and corresponding LOS for unsignalized intersections. The worst LOS at one-way, STOP-controlled, and TWSC intersections represents the delay for the minor approach only.

Table 3-8. Unsignalized intersection control delay and LOS thresholds - HCM 2000 method

\end{tabular}

Source: TRB (2010)

\subsection*{3.7.3 Freeway Operations Analysis}

The LOS for freeway facilities is based on the HCM 2010 method and requires inputs to determine an accurate LOS. Primary inputs include:
- vehicular volumes
- roadway geometry
- speed limits
- truck percentages
- peak hour factor

Freeway facilities are evaluated based on the density of vehicles. The higher the density the slower the vehicles travel and the worse the operations. Based on the vehicle density, the HCM provides LOS equivalents to represent the driver's perception of the facility operation. Table 3-9 shows the density and corresponding LOS for signalized intersections.

\subsection*{3.7.4 Existing Condition Intersection Operations Analysis}

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, one signalized intersection at Gilcreast Road (Intersection \#5) operates at unacceptable conditions (LOS E or LOS F) during the AM peak hour. The remaining signalized intersections in the traffic study area operate at acceptable overall conditions (LOS D or better is considered an acceptable operating level) during the peak hours analyzed (weekday AM and PM peak hours).
Based on the Synchro \({ }^{\text {TM }}\) signalized intersection analysis results, one study area signalized intersection (Intersection \#5) has overall approaches that operate at unacceptable conditions (LOS E or LOS F) during one or two evaluated periods. The following are the individual signalized intersection approaches in the traffic study area that operate under unacceptable conditions during peak hours:
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound and Westbound NH 102 during the AM peak hour
o Northbound Gilcreast Road during the PM peak hour
o Southbound Gilcreast Road during the AM and PM peak hours
Based on the Synchro \({ }^{\text {TM }}\) unsignalized intersection analysis results, the NH 102 at Saint Charles Street/Londonderry Road unsignalized intersection (Intersection \#9) operates at acceptable
conditions (LOS D or better is considered an acceptable operating level) during the two evaluated periods.
Based on the Synchro \({ }^{\mathrm{TM}}\) unsignalized intersection analysis results, the unsignalized Intersection \#9 has overall approaches that operate at unacceptable conditions (LOS E or LOS F) during one or two evaluated periods. The following are the individual unsignalized intersection approaches in the traffic study area that operate under unacceptable conditions during peak hours:

\section*{- NH 102 at Saint Charles Street/Londonderry Road (Intersection \#9)}
o Northbound Saint Charles Street during the PM peak hour
o Southbound Londonderry Road during the AM and PM peak hours
The overall intersection LOS grades are depicted in Figure 3-9. Table 3-10 contains the results of the LOS capacity analysis and the intersection vehicle delay for the existing condition during the AM and PM peak hours. Appendix A contains the Synchro \({ }^{\text {TM }}\) existing conditions intersection analysis reports.

\subsection*{3.7.5 Existing Condition Intersection Queuing Analysis}

In addition to analyzing the vehicle delay, the vehicle queue lengths were calculated for each approach. The 95th percentile queue length is the worst-case scenario, calculated as the queue that has a 5\% probability of being exceeded. A failing queue length is determined by a queue length exceeding the intersection approach storage capacity. Because the available storage for each intersection approach differs, these values reflect whether the existing storage provides enough space for vehicles waiting to pass through the intersection without blocking another lane or another intersection. The study used Synchro \({ }^{\mathrm{TM}}\) to calculate the 95 th percentile queue lengths for the nine signalized intersections and one unsignalized intersection.
Based on the Synchro \({ }^{\text {TM }}\) signalized intersection analysis results, five signalized intersections listed below experience queuing lengths that exceed the available storage capacity. The remaining signalized intersections in the traffic study area provide sufficient storage for the anticipated demand. The lane group in the approach that is operating under unacceptable conditions is noted in parentheses. Table 3-10 contains the queuing results. Appendix B contains the Synchro \({ }^{\mathrm{TM}}\) existing conditions intersection queuing reports.
- NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1)
o Northbound Vista Ridge Drive (right turns) during the AM and the PM peak hours
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 (left turns) during the AM and PM peak hours
o Eastbound NH 102 (right turns and through movements) during the AM peak hour
o Westbound (right turns and through movements) during the PM peak hour
o Southbound Gilcreast Road (left turns and through movements) during the AM peak hour
- NH 102 at Garden Lane (Intersection \#6)
o Northbound Garden Lane (right turns) during the PM peak hour
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp (all movements) during the PM peak hour
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Eastbound NH 102 (all movements) during the PM peak hour
o Westbound NH 102 (all movements) during the AM and PM peak hours
Based on the Synchro \({ }^{\text {TM }}\) unsignalized intersection analysis results, the unsignalized intersection (Intersection \#9) listed below experiences queuing lengths that exceed the available storage capacity.
- NH 102 at Saint Charles/Londonderry Road (Intersection \#9)
o Eastbound NH 102 (left turns) during the PM peak hour
The remaining signalized intersections in the traffic study area provide sufficient storage for the anticipated demand. The lane group in the approach that is operating under unacceptable conditions is highlighted in red In Table 3-10, which contains the queuing results. Note that the percentile values are expressed in feet, and a car occupies about 25 linear feet of roadway, including the space between cars.

\subsection*{3.7.6 Existing Condition Freeway Operations Analysis}

Based on the analysis performed using HCS, all the freeway facilities operate below capacity, operating with a LOS D or better condition during the AM and PM peak hours. In addition, the demand to capacity ratio did not exceed 0.80 where 1.00 equates to the facility operating at capacity. Table 3-11 contains the Exit 4 existing condition freeway analysis and Table 3-12 contains the Exit 5 existing freeway analysis. Appendix C contains the existing conditions HCS freeway operation reports.

\subsection*{3.8 Safety Conditions}

Crash ratings are used in transportation analyses to help determine where additional attention or examination of safety should be undertaken. Crash ratings are evaluated based on recorded crash
information collected by jurisdiction, in this case 3 years of data from NHDOT (2013-2015), and calculated using the crash information and daily volume of vehicles that travel through the intersection. Crash and injury ratings are calculated based on the number of crashes or injuries that would occur per million entering vehicles (MEV) using the following formula:
\[
\text { Rate }=\frac{C * 1,000,000}{n * 365 * V}
\]

In this formula, C is the total number of intersection-related crashes or injuries in the study period, \(n\) is the number of years of data (i.e., study period), and \(V\) is the traffic volumes entering the intersection daily. NHDOT provided the crash information over a 3-year period. Daily traffic volumes were calculated by applying a K factor to the 2015 balanced study area intersection traffic counts (the K factor is defined as the percent of the 24-hour daily vehicle volume that represents the AM or PM peak hour). ATR data covering NH 28 and NH 102 were used to calculate the K factor. Table 3-13 contains the AM and PM K factors for NH 28 and NH 102.

\section*{Table 3-13. NH 28 and NH 102 K factors}

\hline NH 28 North of Liberty Drive & 16,852 & 1,437 & 1,232 & 0.085 & 0.073 \\
\hline NH 102, East of Hampton Drive & 36,771 & 2,531 & 2,896 & 0.069 & 0.079 \\
\hline
\end{tabular}

Table 3-14 presents crash ratings for intersections in the study area using NHDOT crash data (NHDOT 2013-2015). The intersections with the highest crash rating are along NH 102 at the I93 NB off-ramp, Garden Lane/Hampton Drive, and Gilcreast Road. These locations had crash rates greater than 1.00 crashes per MEV. No intersections had injury rates greater than 1.00

Table 3-14. Intersection crash summary

\hline Crashes per million \\
entering vehicles
\end{tabular}\(]\)

Locations with crash rates over 1.0 are highlighted in orange.

Intersections that have a crash rating of greater than 1.0 may warrant further examination to determine if one or more particular causes can be gleaned from the detailed intersection crash data, and if mitigation is advisable, what mitigation measures would help to improve the safety of the intersection. Of the intersections for which sufficient data are available for analysis (a minimum of 3 years of data), three of the intersections have a crash rating of greater than 1.0.
All study area intersections are shown in more detail in Table 3-15, which helps to examine whether there is a high percentage of a particular type of crash. True reasons for a high crash rating cannot solely be determined with crash data because each situation has unique circumstances that are not reflected in the crash study. However, general trends can be determined or certain causes can be eliminated by examining the available crash-specific information. Collisions can be caused by the following roadway factors (FHWA, 2011):
- Access control: too many driveways causing potential conflict points
- Speed: drivers speeding through a congested corridor
- Roadway cross section: lane and shoulder widths do not match facility type
- Traffic volumes: high volume of traffic increasing exposure to more vehicles
- Pavement condition: ruts, potholes, and bumps causing drivers to swerve to avoid obstacles
A number of human and vehicle factors can also lead to crashes.
The data indicate that most crashes between motor vehicles involve rear-end crashes. Rear-end collisions are often the result of two vehicles traveling in the same direction in close proximity where the leading vehicle stops to avoid hitting a vehicle entering the same lane, runs a RED light, or stops or slows down to avoid roadway obstruction or a pavement condition issue. If the trailing vehicle is driving in close proximity not enough space may be available to avoid the collision.

Based on the location of the crashes along NH 102 and the crash types, most of the crashes seem to indicate that access control and pavement condition were not factors because the crashes were spaced out and not all clumped together near a specific driveway junction or other spot. The roadway is designed with a standard cross section with 12 -foot lanes, a shoulder, and the intersections are located along relatively straight sections of roadway. Therefore, the cause of the crashes could be a result of speeding through an area with high traffic volume or potentially distracted drivers not paying attention. Crash data that may provide clues about crash trends are highlighted in orange.

Sources: NHDOT crash data from 2013-2015, received August 30, 2017
Notes: MEV = Million entering vehicles
Crash data that may provide clues about crash trends are highlighted in orange

The freeway crash analysis follows a similar method as the intersection crash analysis to determine the freeway crash rate. A crash rate was calculated for each freeway facility (diverge and merge) and for the I-93 freeway mainline between Exits 4 and 5 by mile. In 2015, Massachusetts calculated an average crash rate for freeways in an urban and rural area of 0.61 and 0.40 , respectively (MassDOT, 2018). Following the more conservative rural measure, all freeway facilities and the two mainline I-93 segments between Exits 4 and 5 had crash rates below 0.40. All locations are shown in Table 3-16.

\end{tabular}

The detailed data identify a high number of crashes with another vehicle and a majority of crashes in the northbound direction occurring during the evening commute period. Most of the crashes occurred on dry pavement on clear days and were scattered along the roadway sections and not clumped in one particular area. Similar to the findings of the intersection analysis, roadway design does not seem to be an issue, rather driver speeding or distracted drivers may be the main reason for the crashes. Another possibility is that heavy rush hour traffic constrained to two lanes could create crashes from aggressive drivers trying to pass slower-moving vehicles by frequently switching lanes. Crash data that may provide clues about crash trends have been highlighted in orange. Table 3-17 provides specific crash types by interstate facility.

\subsection*{4.0 EVALUATION METRICS}

The study developed evaluation criteria to provide a comparison between the different alternatives to help assess the pros and cons of each and support the need to construct a new I-93 Exit 4A interchange. Evaluation criteria include traffic and accessibility. The study also evaluates each policy requirement's pros and cons following the detailed assessment section. Traffic focuses on an operational assessment of the study area facilities (12 intersections and 13 freeway facilities). Accessibility reviews changes in the connectivity of the roadway network to improve or prohibit connections between I-93 and the Londonderry/Derry study area. Table 4-1 summarizes the evaluation criteria. Section 7.0 contains the evaluation criteria and policy requirement summary.

\section*{Table 4-1. Evaluation criteria summary}

\subsection*{5.0 THE NO BUILD CONDITION}

\subsection*{5.1 Introduction}

The No Build condition represents the future conditions in the project design year of 2040 if all planned roadway improvements are implemented, Woodmont Commons is partially built out, and other background growth would follow the demographic projections contained in Tables 3-1, 3-2, and 3-3. I-93 Exit 4A would not occur, and downtown Derry would continue to experience traffic issues. This section summarizes the planned roadway improvements, development of the future traffic volumes, traffic operations, and queuing for the No Build Condition.

\subsection*{5.2 No Build Roadway Improvements}

The No Build condition planned roadway improvements include six upgrades along I-93 and NH 102. Improvements 1 through 3 are currently under construction. Improvements 4 through 6 are options presented as part of the Woodmont Commons PUD. The six improvements are as follows:
1. Widening of the I-93 mainline from two to four lanes in each direction
2. Construction of a new NH 102 bridge over I-93 at Exit 4
3. Upgrade of NH 102 and I-93 ramp termini intersections at Exit 4 (Intersections \#7 and \#8) to include additional turning lanes and align with the revised Exit 4 ramp termini
4. Widening of NH 102 from two through lanes to three through lanes in each direction between Hampton Drive/Garden Lane (Intersection \#6) and Gilcreast Road (Intersection \#5)
5. Additional turning lanes added at NH 102 intersections at Gilcreast Road (Intersection \#5) and Hampton Drive/Garden Lane (Intersection \#6)
6. Upgrade of NH 102 and Londonderry Road/St. Charles Street (Intersection \#9) from unsignalized to a signalized intersections and add additional turning lanes.

Figure 5-1 illustrates improvements 1 through 3, Figure 5-2 illustrates improvements 4 and 5, and Figure 5-3 illustrates improvement 6.

\subsection*{5.3 Development of No Build Volumes}

The future No Build condition volumes for the intersections and freeway facilities serving Exits 4 and 5, as well as the two intersections east of Exit 4, NH 102 at Saint Charles/Londonderry Road \& NH 102 at Fordway/Madden Hill Road (Intersections \#9 and \#10), relied on a custom subarea travel demand model built by the SNHPC. The model values represent 24 -hour vehicle volumes. The AM and PM peak hour volumes were calculated by applying AM and PM peak hour percentages to the 2040 No Build 24-hour model volume results. These percentages were computed by comparing the existing condition peak hour volumes to the 2015 base year 24-hour travel demand model volumes.

Figure 5-1. Planned improvement at I-93 Exits 4 and 5

Source: TEC, 2016
Figure 5-2. Planned improvement along NH 102 between Gilcreast Road and Hampton Drive/Garden Lane

2 Source: TEC, 2016
Figure 5-3. Planned improvement at NH 102 and Londonderry Road/St. Charles Street

Following the same procedure as the existing conditions, the Woodmont Commons Phases I and II TIA was used to provide turning movement counts for the two intersections located west of the I-93 at Exit 4: NH 102 at Gilcreast Road \& NH 102 at Garden Lane (Intersections \#5 and \#6). The volumes in the TIA were forecasted for a partial build-out of the development with roadway mitigation in place by 2017 and were used to calculate the vehicle percentage for each tuning movement. These turning movement percentages were applied to the balanced 2040 No Build condition traffic network at Exit 4 determined by the SNHPC travel demand model.
Following the same procedure as the existing conditions, the I-93 SEIS was used to provide turning movement counts for NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1) located west of I-93 at Exit 5. The No Build condition volume was calculated by applying the vehicle percentage for each tuning movement based on the I-93 SEIS 2030 forecasted vehicle volumes and applying that percentage to the balanced 2040 No Build condition traffic network at Exit 5 determined by the SNHPC travel demand model.
Following the same procedure as the existing conditions, NHDOT provided a turning movement count for NH 28 and Liberty Drive (Intersection \#4) located east of I-93 at Exit 5. This volume was obtained in 2005 and used to calculate the vehicle percentage for each tuning movement and applying that percentage to the balanced 2040 No Build condition traffic network at Exit 5 determined by the SNHPC travel demand model.
Figure 5-4 shows the 2040 No Build condition tuning movement volumes. Figure 5-5 shows the 2040 No Build condition lane geometry. The changes in the lane geometry are based on the proposed mitigation as part of the Woodmont Commons development and affect Intersections \#5, \#6, \#7, and \#8. This is the Phase I Woodmont Commons build-out scenario and includes 312,574 gross square feet of commercial, 510 units residential, and 135 hotel rooms.

Figure 5-4. AM and PM 2040 No Build condition turning movement volumes

Figure 5-5. AM and PM 2040 No Build condition lane geometry

\subsection*{5.4 2040 No Build Condition Intersection Operations Analysis}

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, five signalized intersections (Intersections \#2, \#5, \#7, \#8, and \#9) would operate at unacceptable conditions (LOS E or LOS F) during the AM or PM peak hours. The remaining signalized intersections in the traffic study area would operate at acceptable overall conditions (LOS D or better is considered an operating level) during the peak hours analyzed (weekday AM and PM peak hours).
Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, all the study area signalized intersections, with the exception of Intersection \#4, have overall approaches that would operate at unacceptable conditions (LOS E or LOS F) during one or two evaluated periods. The following individual signalized intersection approaches in the traffic study area would operate under unacceptable conditions during peak hours:
- NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1)
o Southbound Symmes Drive during the AM peak hour
- NH 28 at I-93 Southbound on and off-ramp (Exit 5) (Intersection \#2)
o I-93 Southbound off-ramp during the AM peak hour
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o I-93 Northbound off-ramp during the AM and PM peak hours
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 during the AM and PM peak hours
o Westbound NH 102 during the PM peak hour
o Northbound Gilcreast Road during the AM and PM peak hours
o Southbound NH 102 during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Northbound Hampton Drive during the PM peak hour
o Southbound Garden Lane during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o Eastbound and Westbound NH 102 during the PM peak hour
o I-93 Southbound off-ramp during the PM peak hour
- NH 102 at I-93 Northbound on and off-ramp (Exit 4) (Intersection \#8)
o Eastbound NH 102 during the PM peak hour
- NH 102 at St Charles Street/Londonderry Road (Intersection \#9)
o Eastbound and Westbound NH 102 during the PM peak hour
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Northbound Fordway during the AM and PM peak hours

The overall intersection LOS grades are depicted in Figure 5-6 for AM and PM peak hours. Table 5-1 shows the results of the LOS capacity analysis and the intersection vehicle delay for the No Build condition during the AM and PM peak hours. Appendix D contains the Synchro \({ }^{\mathrm{TM}}\) No Build condition intersection analysis reports.

\subsection*{5.5 2040 No Build Queuing Analysis}

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, all the signalized intersections within the study area, with the exception of NH 28 at Liberty Drive (Intersection \#4), would experience queuing lengths that would exceed the available storage capacity. Intersection \#4 would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is noted in parentheses in the following list. Table \(5-1\) contains the queuing results. Appendix E contains the Synchro \({ }^{\mathrm{TM}}\) No Build condition intersection queuing reports.
- NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1)
o Northbound Vista Ridge Drive (right turns) during the AM and the PM peak hours
o Southbound Symmes Drive (left turns, right turns, and through movements) during the PM peak hour
- NH 28 at I-93 Southbound on and off-ramp (Exit 5) (Intersection \#2)
o Eastbound NH 28 (through movements) during the AM peak hour
o Eastbound NH 28 (right turns) during the AM and PM peak hours
o Westbound NH 28 (left turns) during the AM peak hour
o Southbound I-93 off-ramp (right turns) during the AM peak hour
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o Eastbound NH 28 (left turns) during the AM and PM peak hours
o Eastbound NH 28 (through movements) during the AM peak hour
o Westbound NH 28 (through movements) during the AM peak hour
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 (left turns) during the PM peak hour
o Northbound Gilcreast Road (all movements) during the AM and PM peak hours
o Southbound Gilcreast Road (left turns) during the AM peak hour
o Southbound Gilcreast Road (right turns and through movements) during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Westbound NH 102 (right turns) during the PM peak hour
o Northbound Hampton Drive (right turns) during the AM and PM peak hours
o Southbound Garden Lane (all movements) during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp (all movements) during the AM ad PM peak hours
- NH 102 at I-93 Northbound on and off-ramp (Exit 4) (Intersection \#8)
o Westbound NH 102 (right turns) during the AM peak hour
- NH 102 at St Charles Street/Londonderry Road (Intersection \#9)
o Eastbound NH 102 (left turns) during the PM peak hour
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Eastbound NH 102 (all movements) during the PM peak hour
o Westbound NH 102 (all movements) during the AM and PM peak hours
Intersection \#4 is the only signalized intersection in the traffic study area that would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is highlighted in red in Table 5-1, which contains the queuing results.

\({ }^{\text {a }}\) Highway Capacity Manual 2000 results (Signalized intersections)

\subsection*{5.6 2040 No Build Condition Freeway Operations Analysis}

Based on the analysis performed using HCS, one freeway facility would operate above capacity. This includes the I-93 SB off-ramp to NH 102 that would operate at LOS F. This facility would fail due to the off-ramp operating over capacity, thus queueing onto the I-93 mainline. The NH 102 on-ramp to I-93 NB would operate above capacity potentially creating a queue into the NH 102 mainline. Table 5-2 contains the Exit 4 No Build condition freeway analysis, and Table 5-3 contains the Exit 5 No Build freeway analysis. Appendix F contains the No Build condition HCS freeway operation reports.

Table 5-2. I-93 Exit 42040 No Build freeway analysis

\subsection*{6.0 ALTERNATIVE DESCRIPTION}

The proposed Project would entail the construction of a new interchange between I-93 Exit 4 and Exit 5 in Londonderry, New Hampshire. The location of the new interchange has been narrowed to two locations, the first option is located approximately 1.5 miles north of Exit 4 and 2.3 miles south of Exit 5, and the second option is located 2 miles north of Exit 4 and 1.5 miles south of Exit 5 . For each option, a diamond interchange would be constructed with two signalized intersections located on either side of I-93 serving the ramp termini. Four proposed alternatives include a new interchange along I-93 as follows:
- Alternative A: New I-93 interchange 1.5 miles north of Exit 4, connects to the east to Folsom Road and includes improvements along Folsom Road and Tsienneto Road providing a new direct connection between I-93 and NH 102, east of Beaver Lake. The land use assumptions for the traffic analysis of this alternative assume the Woodmont Commons full build-out.
- Alternative B: New I-93 interchange 1.5 miles north of Exit 4, creates a new alignment 0.5 mile north of Folsom Road that runs parallel, then follows a power line ROW before connecting to NH 102 east of Beaver Lake. The land use assumptions for the traffic analysis of this alternative assume the Woodmont Commons full buildout
- Alternative C: New I-93 interchange 2 miles north of Exit 4, creates a new alignment along a power line ROW before connecting to NH 28, then follows the same ROW as Alternative B beginning at Ashleigh Drive, connecting to NH 102 east of Beaver Lake. Because Alternative C would not provide access to the undeveloped land on the east side of I-93 within the Woodmont Commons PUD, the Woodmont Commons development under Alternative C would be the same as the No Build Alternative.
- Alternative D: New I-93 interchange 2 miles north of Exit 4, creates a new alignment along a power line ROW before connecting to NH 28, then follows the same ROW as Alternative A beginning at Folsom Road, connecting to NH 102 east of Beaver Lake. The Woodmont Commons Phase I scenario is included in this alternative. Similar to Alternative C, this alternative would not provide access to the undeveloped land on the east side of I-93 within the Woodmont Commons PUD; therefore, the Woodmont Commons development under Alternative D would be the same as the No Build Alternative.
There is also Alternative F that can be considered the Transportation Systems Management (TSM) alternative composed of intersection improvements along NH 102 between Londonderry Road and Londonderry Turnpike that does not contain a new I-93 interchange. The next section contains detailed descriptions for each alternative.
Figure 6-1 illustrates the five SDEIS alternatives.

Figure 6-1. I-93 Exit 4A SDEIS alternatives

\subsection*{6.1 Build Alternatives Description}

\subsection*{6.1.1 Alternative A}

Alternative A was the Preferred Alternative in the 2007 DEIS (FHWA, 2007). This alternative includes a corridor that is approximately 3.2 miles in length between the new proposed I-93 Exit 4A interchange and eastern Derry. There would be approximately one mile of roadway construction on a new alignment and approximately 1.6 miles of existing roadway reconstruction, and approximately 0.6 mile of roadway with no improvements. It would originate from the southern I-93 Exit 4A interchange location and travel northeast along new alignment through a wooded area to Folsom Road, near its intersection with North High Street and Madden Road. This alternative would continue to follow Folsom Road past Ross’ Corner (Manchester Road/NH 28) and continue on Tsienneto Road across NH 28 Bypass to its end at NH 102, adjacent to Beaver Lake. Specific improvements are outlined below:

\section*{I-93 Exit 4A to Ross' Corner}

The section would contain five lanes of mostly new construction.

\section*{Ross' Corner Reconstruction}

Ross' Corner would require additional eastbound through and left-turn lanes and an additional westbound through-lane to handle the traffic added by Alternative A. The intersection of Tsienneto Road and Pinkerton Street would also require additional through-lanes and would be signalized.

\section*{Tsienneto Road from Ross' Corner to NH 28 Bypass}

The portion is an existing three-lane roadway (one lane in each direction with a middle turn lane) that would not be altered with this Project.

\section*{NH 28 Bypass/Tsienneto Road Intersection Reconstruction}

This intersection would also require an additional through-lane in each direction on Tsienneto Road.

Tsienneto Road from NH 28 Bypass to NH 102
This section would require completion of minor safety improvements on the east end of Tsienneto Road.

Tsienneto Road/NH 102 Intersection Reconstruction
This intersection would need to be signalized, with added turning lanes on NH 102 and Tsienneto Road.

\subsection*{6.1.2 Alternative B}

The Alternative B corridor is approximately 3.4 miles in length between the new proposed I-93 Exit 4A interchange and eastern Derry. The entire 3.4-mile corridor would consist of roadway construction on new alignment. It would originate from a new southern I-93 Exit 4A interchange
and travel northeast along a new alignment through a wooded area to the intersection of Ashleigh Drive and NH 28. From this intersection, this alternative would extend northeast towards the intersection of London Road and NH 28 Bypass and then continue on new alignment to the intersection of Tsienneto Road and NH 102. Specific improvements would be as follows:

\section*{I-93 Exit 4A to Ashleigh Drive/NH 28 Intersection}

The section leading from the new southern I-93 Exit 4A interchange to the intersection of Ashleigh Drive and NH 28 would contain five lanes of mostly new construction.

\section*{Ashleigh Drive/NH 28 Intersection Reconstruction}

This intersection would require addition eastbound left-turn lane and a new through lane and westbound through lane and shared through/right-turn lane. The NH 28 northbound approach would include a minor change to the lane geometry with the removal of the exclusive right-turn lane.

\section*{Corridor from NH 28 to NH 28 Bypass}

The portion would follow a new alignment following Ashleigh Drive to the power line ROW, then following the power line ROW to the NH 28 Bypass. This section would be a three-lane roadway (one lane in each direction with a middle turn lane).

\section*{NH 28 Bypass Intersection Construction}

There would be a new signalized intersection constructed with all four approaches containing a left-turn lane. The southbound approach would contain a right-turn lane, and the remaining approaches would contain shared through/right-turn lanes.

\section*{Corridor from NH 28 Bypass to NH 102}

This section would follow the power line ROW, then head southeast through a wooded section to intersect with Tsienneto Road and NH 102. It would contain two lanes.

\section*{Tsienneto Road/NH 102 Intersection Reconstruction}

This intersection would need to be signalized, with added turning lanes on NH 102 and Tsienneto Road.

\subsection*{6.1.3 Alternative C}

The Alternative C corridor is approximately 3.7 miles in length between the new proposed I-93 Exit 4A interchange and eastern Derry. Approximately 2.9 miles of corridor would be on new alignment, while approximately 0.8 mile would reconstruct existing roadways. The alternative would start from a new northern I-93 Exit 4A interchange and travel east approximately 0.7 mile along a power line ROW to NH 28. Following NH 28 south to the intersection of Ashleigh Drive, it would follow the same alignment as Alternative B to the intersection of Tsienneto Road and NH 102. Specific improvements would be as follows:

\section*{I-93 Exit 4A to Ashleigh Drive/NH 28 Intersection}

The section leading from the northern I-93 Exit 4A interchange option to the intersection of Ashleigh Drive and NH 28 would contain five lanes. Between Exit 4A and Scobie Pond Road, there would be new roadway construction that would tie into NH 28, an existing five-lane roadway.

\section*{Ashleigh Drive/NH 28 Intersection Reconstruction}

This intersection would require a minor change to the westbound approach lane geometry by changing the left-turn lane into a shared left/through lane and the right lane into a right-turn lane. The NH 28 northbound approach would include a minor change to the lane geometry with the removal of the exclusive right-turn lane.

\section*{Corridor from NH 28 to NH 28 Bypass}

This portion would be the same as Alternative B.

\section*{NH 28 Bypass Intersection Construction}

This intersection would be the same as Alternative B.

\section*{Corridor from NH 28 Bypass to NH 102}

This portion would be the same as Alternative B.
Tsienneto Road/NH Route 102 Intersection Reconstruction
This intersection would need to be signalized, with added turning lanes on NH 102 and Tsienneto Road.

\subsection*{6.1.4 Alternative D}

The Alternative D corridor is approximately 3.9 miles in length between the new proposed I-93 Exit 4A interchange and eastern Derry. Within this corridor, approximately 0.8 mile would be on new alignment, 2.5 mile on existing roadways would be reconstructed, and 0.6 mile would have no improvements. The alternative would commence from a new northern I-93 Exit 4A interchange and travel east approximately 0.7 mile along a power line ROW to NH 28. Following NH 28 south to Ross' Corner, the corridor would then follow the same path as Alternative A to the intersection of Tsienneto Road and NH 102. Specific improvements would be as follows:

\section*{l-93 Exit 4A to Ross' Corner}

Alternative D, originating from the northern I-93 Exit 4A interchange option, would traverse south on NH Route 28 to Ross' Corner. The section leading from the northern I-93 Exit 4A interchange option to the intersection at Ross' Corner would contain five lanes. Between Exit 4A and Scobie Pond Road, there would be new roadway construction that would tie into NH 28, an existing five-lane roadway.

\section*{Ross' Corner Reconstruction}

Ross’ Corner would require an additional eastbound through-lane, and an additional southbound through-lane to handle the traffic. The intersection of Tsienneto Road and Pinkerton Street would also require additional through-lanes on Tsienneto Road, in addition to being signalized.

Tsienneto Road from Ross' Corner to NH 28 Bypass
This portion would be the same as Alternative A.
NH 28 Bypass/Tsienneto Road Intersection Reconstruction
This intersection would be the same as Alternative A.
Tsienneto Road from NH 28 Bypass to NH 102
This portion would be the same as Alternative A.

\section*{Tsienneto Road/NH 102 Intersection Reconstruction}

This intersection would be the same as Alternative A.

\subsection*{6.1.5 Alternative \(F\)}

Alternative F focuses all improvements along the existing NH 102 corridor between Exit 4 at I93 and downtown Derry. A two-way center left-turn lane would be constructed from Londonderry Road to NH Route 28. The majority of existing on-street parking spaces would be lost to accommodate the center turn lane. Additional improvements included in the study area would be as follows:

\section*{NH 102/Londonderry Road/St. Charles Street}

There would be improvements to three approaches. The eastbound and westbound approaches would include a new left-turn lane and an additional through lane. The southbound approach would include an extension to the existing right-turn lane. The signal would be upgraded to operate the new lane geometry.

\section*{NH 102/Fordway/Madden Hill Road}

There would be improvements to two approaches. The eastbound approach would include a new right-turn lane, and the northbound approach would include a new left-turn lane. The signal would be upgraded to operate the new lane geometry. There would also be a three-lane cross section along NH 102 between Fordway and Crystal Avenue and additional lanes added to the NH 102 and Crystal Avenue/Birch Street intersection.

\subsection*{7.0 THE 2040 BUILD CONDITION}

\subsection*{7.1 Introduction}

The Build condition represents the future conditions with one of the five alternatives constructed. This section summarizes development of the future traffic volumes, traffic operations, and queuing for the Build condition.

\subsection*{7.2 Development of 2040 Build Condition Volumes}

The 2040 Build conditions represent the future conditions if all planned roadway improvements are implemented, Woodmont Commons is either fully built out or partially built out, and other background growth would follow the demographic projections contained in Tables 3-4, 3-5, and 3-6. I-93 Exit 4A would occur, and, under four of the alternatives, downtown Derry's traffic congestion would be improved. This section summarizes the development of the future traffic volumes, traffic operations, and queuing for the Build conditions.

The study relied on the SNHPC travel demand model, especially for modeling future forecasted traffic volumes generated by the Woodmont Commons PUD. Woodmont Commons is planned to include a variety of land uses such as residential, commercial, and office that could encourage a reduced number of daily work-based vehicle trips. The reduction in work-based trips is called internal capture and refers to a pedestrian or bicycle trip replacing a vehicle trip based on the origin and destination both located at Woodmont Commons. Because the travel demand model was unable to account for internal capture trips, the model likely forecasted more daily vehicle trips than might occur.
The future 2040 Build condition volumes for the intersections and freeway facilities serving Exits 4 and 5, as well as the two intersections east of Exit 4, NH 102 at Saint
Charles/Londonderry Road \& NH 102 at Fordway/Madden Hill Road (Intersections \#9 and \#10), relied on a custom travel demand model built by SNHPC to represent each alternative, resulting in five models. The model values represent 24 -hour vehicle volumes; therefore, the AM and PM peak hour volumes were calculated by applying AM and PM peak hour percentages to each of the five 2040 Build 24-hour model volume results. These percentages were computed by comparing the existing condition peak hour volumes to the 2015 base year 24-hour travel demand model volumes.
Following a procedure similar to that used for the existing conditions, the Woodmont Commons TIA published Phases I and II traffic counts or Woodmont Commons PUD traffic counts were used to provide turning movement counts for the two intersections located west of I-93 at Exit 4, NH 102 at Gilcreast Road \& NH 102 at Garden Lane (Intersections \#5 and \#6). The volumes in the TIA were used to calculate the vehicle percentage for each tuning movement as follows: (1) Alternatives A and B used the PUD traffic counts representing the full Woodmont Commons build-out; and (2) Alternatives C, D, and F used the Phase I and II traffic counts representing the partial Woodmont Commons build-out. These turning movement percentages were applied to the five balanced 2040 Build condition traffic networks at Exit 4 determined by the five SNHPC travel demand models representing each alternative.
Following the same procedure used for the existing conditions, the I-93 SEIS was used to provide turning movement counts for NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1) located west of I-93 at Exit 5. The Build condition volumes were calculated by applying the
vehicle percentage for each tuning movement based on the I-93 SEIS 2030 forecasted vehicle volumes and applying that percentage to the five (Alternatives A, B, C, D, and F) balanced 2040 Build condition traffic networks at Exit 5 determined by the five SNHPC travel demand models representing each alternative.
Following the same procedure as the existing conditions, NHDOT provided a turning movement count for NH 28 and Liberty Drive (Intersection \#4) located east of I-93 at Exit 5. This volume was obtained in 2005 and used to calculate the vehicle percentage for each tuning movement and applying that percentage to the five (Alternatives A, B, C, D, and F) balanced 2040 Build condition traffic networks at Exit 5 determined by the five SNHPC travel demand model representing each alternative.
The proposed new interchange (I-93 Exit 4A) would contain two new intersections with the same lane geometry regardless of the alternative chosen (A, B, C, or D). The Connector Road and I-93 SB on and off-ramp (Intersection \# 11) would be signalized and contain two approaches. The other intersection, Connector Road and I-93 NB on and off-ramp (Intersection \#12) would be signalized and contain three approaches.
Figures 7-1 through 7-5 show the 2040 Build condition turning movement volumes representing Alternatives A, B, C, D, and F. Figure 7-6 shows the Alternatives A and B lane geometry. Figure 7-7 shows the Alternatives C and D lane geometry. Figure 7-8 shows the Alternative F lane geometry. The location of Exit 4A differs between the alternatives; however, the lane geometry remains the same for Alternatives A through D.

\subsection*{7.3 2040 Build Alternative A Intersection Operations Analysis}

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, four signalized intersections (Intersections \#3, \#5, \#6, and \#8) would operate at unacceptable conditions (LOS E or LOS F) during the AM or PM peak hours. The remaining signalized intersections in the traffic study area would operate at acceptable overall conditions (LOS D or better is considered an operating level) during the peak hours analyzed (weekday AM and PM peak hours).

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, eight of the study area signalized intersections have overall approaches that would operate at unacceptable conditions (LOS E or LOS F) during one or two evaluated periods. The following individual signalized intersection approaches in the traffic study area would operate under unacceptable conditions during peak hours:
- NH 28 at I-93 Southbound on and off-ramp (Exit 5) (Intersection \#2)
o I-93 Southbound off-ramp during the AM peak hour
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o Westbound NH 28 during the AM peak hour.
o I-93 Northbound off-ramp during the AM and PM peak hours
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 during the AM and PM peak hours
o Westbound NH 102 during the PM peak hour
o Northbound Gilcreast Road during the AM and PM peak hours
o Southbound Gilcreast Road during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Eastbound NH 102 during the PM peak hour
o Westbound NH 102 during the PM peak hour
o Northbound Hampton Drive during the AM and PM peak hours
o Southbound Garden Lane during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp during the PM peak hour
- NH 102 at I-93 Northbound on and off-ramp (Exit 4) (Intersection \#8)
o Eastbound NH 102 during the AM and PM peak hours
o Westbound NH 102 during the AM peak hour
o I-93 Northbound on-ramp during the AM and PM peak hours
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Northbound Fordway during the AM and PM peak hours
- Connector Roadway and I-93 Southbound on and off-ramp (Exit 4A) (Intersection \#11)
o Westbound Connector Roadway during the AM peak hour
The overall Alternative A intersection LOS grades are depicted in Figure 7-9 for AM and PM peak hours. Table 7-1 shows the comparison between Alternative A and No Build condition LOS capacity analysis and the intersection vehicle delay results during the AM and PM peak hours. Appendices G, H, and I contain the Synchro \({ }^{\mathrm{TM}}\) Build condition intersection analysis reports.

\subsection*{7.4 2040 Build Alternative A Queuing Analysis}

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, nine of the signalized intersections within the study area would experience queuing lengths that would exceed the available storage capacity. Intersections \#4, \#8, and \#9 would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is noted in parentheses. Table 7-1 contains the queuing results. Appendices J, K, and L contain the Synchro \({ }^{\mathrm{TM}}\) Build condition intersection queuing reports.
- NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1)
o Northbound Vista Ridge Drive (right turns) during the AM and the PM peak hours
o Southbound Symmes Drive (left turns, right turns, and through movements) during the PM peak hour
- NH 28 at I-93 Southbound on and off-ramp (Exit 5) (Intersection \#2)
o Eastbound NH 28 (right turns) during the AM peak hour
o Westbound NH 28 (left turns) during the AM peak hour
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o Eastbound NH 28 (left turns) during the AM peak hour
o Westbound NH 28 (through movements) during the AM peak hour
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 (left turns) during the AM and PM peak hours
o Northbound Gilcreast Road (all movements) during the AM and PM peak hours
o Southbound Gilcreast Road (left turns) during the AM peak hour
o Southbound Gilcreast Road (right turns and through movements) during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Eastbound NH 102 (left turns) during the AM and PM peak hours
o Eastbound NH 102 (right turns and through movements) during the AM peak hour
o Westbound NH 102 (right turns) during the AM and PM peak hours
o Northbound Hampton Drive (right turns) during the AM and PM peak hours
o Southbound Garden Lane (all movements) during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp (all movements) during the AM ad PM peak hours
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Eastbound NH 102 (all movements) during the PM peak hour
o Westbound NH 102 (all movements) during the AM and PM peak hours
o Southbound Madden Hill Road during the PM peak hour
- Connector Roadway and I-93 Southbound on and off-ramp (Exit 4A) (Intersection \#11)
o Westbound Connector Roadway (left turns) during the AM peak hour
- Connector Roadway and I-93 Northbound on and off-ramp (Exit 4A) (Intersection \#12)
o Westbound Connector Roadway (right turns) during the AM and PM peak hours The remaining signalized intersections in the traffic study area would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is highlighted in red in Table 7-1, which contains a comparison between Alternative A and No Build condition queuing results.

Table 7-1. Comparison between Alternative A and No Build condition intersection capacity and queuing analyses (continued)

1
Table 7-1. Comparison between Alternative \(A\) and No Build condition intersection capacity and queuing analyses (continued)

Notes:
\# 95th percentile volume exceeds capacity, queue may be longer.
EB = Eastbound, WB = Westbound, NB= Northbound, SB = Southbound
LOS \(=\) Level of Service
LTR \(=\) left / through / right lanes
V/C = Volume-to-Capacity ratio
Delay is Measured in Seconds Per Vehicle.
Red cells denote intersections or approaches operating at unacceptable conditions or denote approaches and lane groups whose queuing length exceeds capacity
\({ }^{\text {a }}\) Highway Capacity Manual 2000 results (Signalized intersections)

\subsection*{7.5 2040 Build Alternative A Freeway Operations Analysis}

Analysis performed using HCS shows all freeway facilities would operate below capacity. The one failing freeway facility under the No Build condition (the I-93 SB off-ramp to NH 102) would improve to LOS A. Table 7-2 contains the Exit 4 Alternative A freeway analysis compared to the No Build condition, and Table 7-3 contains the Exit 5 Alternative A freeway analysis compared to the No Build condition. Table 7-4 contains the Exit 4A Alternative A freeway analysis. Appendix M contains the Build condition HCS freeway operation reports.

\subsection*{7.6 2040 Build Alternative B Intersection Operations Analysis}

Based on the Synchro \({ }^{\text {TM }}\) signalized intersection analysis results, three signalized intersections (Intersections \#5, \#6, and \#8) would operate at unacceptable conditions (LOS E or LOS F) during the AM or PM peak hours. The remaining signalized intersections in the traffic study area would operate at acceptable overall conditions (LOS D or better is considered an operating level) during the peak hours analyzed (weekday AM and PM peak hours).
Based on the Synchro \({ }^{\text {TM }}\) signalized intersection analysis results, eight of the study area signalized intersections have overall approaches that would operate at unacceptable conditions (LOS E or LOS F) during one or two evaluated periods. The following individual signalized intersection approaches in the traffic study area would operate under unacceptable conditions during peak hours:
- NH 28 at I-93 Southbound on and off-ramp (Exit 5) (Intersection \#2)
o I-93 Southbound off-ramp during the AM peak hour
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o I-93 Northbound off-ramp during the AM peak hour
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 during the AM and PM peak hours
o Westbound NH 102 during the PM peak hour
o Northbound Gilcreast Road during the AM and PM peak hours
o Southbound Gilcreast Road during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Eastbound NH 102 during the PM peak hour
o Westbound NH 102 during the PM peak hour
o Northbound Hampton Drive during the AM and PM peak hours
o Southbound Garden Lane during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp during the PM peak hour
- NH 102 at I-93 Northbound on and off-ramp (Exit 4) (Intersection \#8)
o Eastbound NH 102 during the PM peak hour
o I-93 Northbound off-ramp during the AM and PM peak hours
- Connector Roadway and I-93 Southbound on and off-ramp (Exit 4A) (Intersection \#11)
o I-93 Southbound off-ramp during the AM peak hour
- Connector Roadway and I-93 Northbound on and off-ramp (Exit 4A) (Intersection \#12)
o I-93 Northbound on-ramp during the AM and PM peak hours
The overall Alternative B intersection LOS grades are depicted in Figure 7-10 for AM and PM peak hours. Table 7-5 shows the comparison between Alternative B and No Build condition LOS capacity analysis and the intersection vehicle delay results during the AM and PM peak hours. Appendices G, H, and I contain the Synchro \({ }^{\mathrm{TM}}\) Build condition intersection analysis reports.

\subsection*{7.7 2040 Build Alternative B Queuing Analysis}

Based on the Synchro \({ }^{\text {TM }}\) signalized intersection analysis results, eight of the signalized intersections within the study area would experience queuing lengths that would exceed the available storage capacity. Intersections \#2, \#4, \#8, and \#9 would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is noted in parentheses. Table 7-5 contains the queuing results. Appendices J, K, and L contain the Synchro \({ }^{\mathrm{TM}}\) Build condition intersection queuing reports.
- NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1)
o Northbound Vista Ridge Drive (right turns) during the AM and the PM peak hours
o Southbound Symmes Drive (left turns, right turns, and through movements) during the PM peak hour
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o Eastbound NH 28 (left turns) during the AM and PM peak hours
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 (left turns) during the AM and PM peak hours
o Northbound Gilcreast Road (left turns) during the AM and PM peak hours
o Northbound Gilcreast Road (right turns) during the PM peak hour
o Southbound Gilcreast Road (left turns) during the AM peak hour
o Southbound Gilcreast Road (right turns and through movements) during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Eastbound NH 102 (left turns) during the AM and PM peak hours
o Eastbound NH 102 (right turns and through movements) during the AM peak hour
o Westbound NH 102 (right turns) during the AM and PM peak hours
o Northbound Hampton Dr. (right turns) during the AM and PM peak hours
o Southbound Garden Lane (all movements) during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp (all movements) during the AM and PM peak hours
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Eastbound NH 102 (right turns and through movements) during the PM peak hour
o Westbound NH 102 (all movements) during the AM and PM peak hours
- Connector Roadway and I-93 Southbound on and off-ramp (Exit 4A) (Intersection \#11)
o Westbound Connector Roadway (left turns) during the AM and PM peak hours
o I-93 Southbound off-ramp (left turns) during the AM peak hour
- Connector Roadway and I-93 Northbound on and off-ramp (Exit 4A) (Intersection \#12)
o Westbound Connector Roadway (right turns) during the AM and PM peak hours
o I-93 Northbound on-ramp (all movements) during the AM peak hour
The remaining signalized intersections in the traffic study area would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is highlighted in red in Table 7-5, which contains a comparison between Alternative B and No Build condition queuing results.

\({ }^{\text {a }}\) Highway Capacity Manual 2000 results (Signalized intersections)

\subsection*{7.82040 Build Alternative B Freeway Operations Analysis}

Based on the analysis performed using HCS, all freeway facilities would operate below capacity. The one failing freeway facility under the No Build condition would improve to LOS C. This includes the I-93 SB off-ramp to NH 102. The NH 102 on-ramp to I-93 NB would operate above capacity potentially creating a queue into the NH 102 mainline. Table 7-6 contains the Exit 4 Alternative B freeway analysis compared to the No Build condition, and Table 7-7 contains the Exit 5 Alternative B freeway analysis compared to the No Build condition. Table 7-8 contains the Exit 4A Alternative B freeway analysis. Appendix M contains the Build condition HCS freeway operation reports.

\subsection*{7.9 2040 Build Alternative C Intersection Operations Analysis}

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, three signalized intersections (Intersections \#5, \#7, and \#8) would operate at unacceptable conditions (LOS E or LOS F) during the AM or PM peak hours. The remaining signalized intersections in the traffic study area would operate at acceptable overall conditions (LOS D or better is considered an operating level) during the peak hours analyzed (weekday AM and PM peak hours).
Based on the Synchro \({ }^{\text {TM }}\) signalized intersection analysis results, six study area signalized intersections have overall approaches that would operate at unacceptable conditions (LOS E or LOS F) during one or two evaluated periods. The following are the individual signalized
intersection approaches in the traffic study area that would operate under unacceptable conditions during peak hours:
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o I-93 Northbound off-ramp during the AM peak hour
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 during the AM and PM peak hours
o Westbound NH 102 during the PM peak hour
o Northbound Gilcreast Road during the AM and PM peak hours
o Southbound NH 102 during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Northbound Hampton Drive during the AM and PM peak hours
o Southbound Garden Lane during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp during the PM peak hour
- NH 102 at I-93 Northbound on and off-ramp (Exit 4) (Intersection \#8)
o Eastbound NH 102 during the PM peak hour
o Westbound NH 102 during the AM peak hour
o I-93 Northbound off-ramp during the AM and PM peak hours
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Northbound Fordway during the PM peak hour
The overall Alternative C intersection LOS grades are depicted in Figure 7-11 for AM and PM peak hours. Table 7-9 shows the comparison between Alternative C and No Build condition LOS capacity analysis and the intersection vehicle delay results during the AM and PM peak hours. Appendices G, H, and I contain the Synchro \({ }^{\mathrm{TM}}\) Build condition intersection analysis reports.

\subsection*{7.10 2040 Build Alternative C Queuing Analysis}

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, seven signalized intersections within the study area, would experience queuing lengths that would exceed the available storage capacity. Intersections \#2, \#4, \#8, \#9, and \#11 would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is noted in parentheses. Table 7-9 contains the queuing results. Appendices J, K, and L contain the Synchro \({ }^{\mathrm{TM}}\) Build condition intersection queuing reports.
- NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1)
o Northbound Vista Ridge Drive (right turns) during the AM and the PM peak hours
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o Eastbound NH 28 (left turns) during the AM peak hour
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 (left turns) during the PM peak hour
o Northbound Gilcreast Road (all movements) during the AM and PM peak hours
o Southbound Gilcreast Road (all movements) during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Eastbound NH 102 (left turns) during the PM peak hour
o Eastbound NH 102 (right turns and through movements) during the AM peak hour
o Westbound NH 102 (right turns) during the PM peak hour
o Northbound Hampton Drive (right turns) during the AM and PM peak hours
o Southbound Garden Lane (all movements) during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp (right turns) during the AM ad PM peak hours
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Eastbound NH 102 (all movements) during the PM peak hour
o Westbound NH 102 (all movements) during the AM and PM peak hours
- Connector Roadway and I-93 Northbound on and off-ramp (Exit 4A) (Intersection \#12)
o Westbound Connector Roadway (right turns) during the AM and PM peak hours The remaining signalized intersections in the traffic study area would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is highlighted in red in Table 7-9, which contains a comparison between Alternative C and No Build condition queuing results.

\subsection*{7.112040 Build 2040 Alternative C Freeway Operations Analysis}

Based on the analysis performed using HCS, all freeway facilities would operate below capacity and result in LOS C or better. The one failing freeway facility under the No Build condition would improve to LOS C. This includes the I-93 SB off-ramp to NH 102. Table 7-10 contains the Exit 4 Alternative C freeway analysis compared to the No Build condition and Table 7-11 contains the Exit 5 Alternative C freeway analysis compared to the No Build condition. Table 712 contains the Exit 4A Alternative C freeway analysis. Appendix M contains the Build condition HCS freeway operation reports.

\subsection*{7.12 2040 Build Alternative D Intersection Operations Analysis}

Based on the Synchro \({ }^{\text {TM }}\) signalized intersection analysis results, four signalized intersections (Intersections \#5, \#6, \#7, and \#8) would operate at unacceptable conditions (LOS E or LOS F) during the AM or PM peak hours. The remaining signalized intersections in the traffic study area would operate at acceptable overall conditions (LOS D or better is considered an operating level) during the peak hours analyzed (weekday AM and PM peak hours).
Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, six of the study area signalized intersections have overall approaches that would operate at unacceptable conditions (LOS E or LOS F) during one or two evaluated periods. The following are the individual signalized
intersection approaches in the traffic study area that would operate under unacceptable conditions during peak hours:
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o I-93 Northbound off-ramp during the AM peak hour
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 during the AM and PM peak hours
o Westbound NH 102 during the AM and PM peak hours
o Northbound Gilcreast Road during the AM and PM peak hours
o Southbound NH 102 during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Northbound Hampton Drive during the AM and PM peak hours
o Southbound Garden Lane during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp during the PM peak hour
- NH 102 at I-93 Northbound on and off-ramp (Exit 4) (Intersection \#8)
o Eastbound NH 102 during the PM peak hour
o Westbound NH 102 during the AM peak hour
o I-93 Northbound off-ramp during the AM and PM peak hours
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Northbound Fordway during the PM peak hour
The overall Alternative D intersection LOS grades are depicted in Figure 7-12 for AM and PM peak hours. Table 7-13 shows the comparison between Alternative D and No Build condition LOS capacity analysis and the intersection vehicle delay results during the AM and PM peak hours. Appendices G, H, and I contain the Synchro \({ }^{\mathrm{TM}}\) Build condition intersection analysis reports.

\subsection*{7.13 2040 Build Alternative D Queuing Analysis}

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, seven signalized intersections within the study area would experience queuing lengths that would exceed the available storage capacity. Intersections \#2, \#4, \#8, \#9, and \#11 would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is noted in parentheses. Table 7-13 contains the queuing results. Appendices \(\mathrm{J}, \mathrm{K}\), and L contain the Synchro \({ }^{\mathrm{TM}}\) Build condition intersection queuing reports.
- NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1)
o Northbound Vista Ridge Drive (right turns) during the AM and the PM peak hours
o Southbound Symmes Drive (left turns, right turns, and through movements) during the PM peak hour
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o Eastbound NH 28 (left turns) during the AM peak hour
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 (left turns) during the PM peak hour
o Northbound Gilcreast Road (all movements) during the AM and PM peak hours
o Southbound Gilcreast Road (all movements) during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Eastbound NH 102 (right turns and through movements) during the AM peak hour
o Westbound NH 102 (right turns) during the PM peak hour
o Northbound Hampton Drive (right turns) during the AM and PM peak hours
o Southbound Garden Lane (all movements) during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp (right turns) during the AM ad PM peak hours
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Eastbound NH 102 (all movements) during the PM peak hour
o Westbound NH 102 (all movements) during the AM and PM peak hours
- Connector Roadway and I-93 Northbound on and off-ramp (Exit 4A) (Intersection \#12)
o Westbound Connector Roadway (right turns) during the AM and PM peak hours The remaining signalized intersections in the traffic study area would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is highlighted in red in Table 7-13, which contains a comparison between Alternative D and No Build condition queuing results.

Notes:
\# 95th percentile volume exceeds capacity, queue may be longer.
\(\mathrm{EB}=\) Eastbound, \(\mathrm{WB}=\) Westbound, \(\mathrm{NB}=\) Northbound, \(\mathrm{SB}=\) Southbound
LOS = Level of Service
LTR \(=\) left / through / right lanes
V/C = Volume-to-Capacity ratio
Delay is Measured in Seconds Per Vehicle.
Red cells denote intersections or approaches operating at unacceptable conditions or denote approaches and lane groups whose queuing length exceeds capacity
\({ }^{\text {a }}\) Highwav Cadacitv Manual 2000 results (Signalized intersections)

\subsection*{7.14 2040 Build Alternative D Freeway Operations Analysis}

Based on the analysis performed using HCS, all freeway facilities would operate below capacity and result in LOS C or better. The one failing freeway facility under the No Build condition would improve to LOS C. This includes the I-93 SB off-ramp to NH 102. Table 7-14 contains the Exit 4 Alternative D freeway analysis compared to the No Build condition and Table 7-15 contains the Exit 5 Alternative D freeway analysis compared to the No Build condition. Table 716 contains the Exit 4A Alternative D freeway analysis. Appendix M contains the Build condition HCS freeway operation reports.

\subsection*{7.15 2040 Build Alternative F Intersection Operations Analysis}

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, four signalized intersections (Intersections \#2, \#5, \#7, and \#8) would operate at unacceptable conditions (LOS E or LOS F) during the AM or PM peak hours. The remaining signalized intersections in the traffic study area would operate at acceptable overall conditions (LOS D or better is considered an operating level) during the peak hours analyzed (weekday AM and PM peak hours).
Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, all the study area signalized intersections, with the exception of Intersection \#4, have overall approaches that would operate at unacceptable conditions (LOS E or LOS F) during one or two evaluated periods. The following are the individual signalized intersection approaches in the traffic study area that would operate under unacceptable conditions during peak hours:
- NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1)
o Southbound Symmes Drive during the AM peak hour
- NH 28 at I-93 Southbound on and off-ramp (Exit 5) (Intersection \#2)
o Eastbound NH 28 during the AM peak hour
o I-93 Southbound off-ramp during the AM peak hour
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)
o I-93 Northbound off-ramp during the AM and PM peak hours
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 during the AM and PM peak hours
o Westbound NH 102 during the PM peak hour
o Northbound Gilcreast Road during the AM and PM peak hours
o Southbound NH 102 during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Northbound Hampton Drive during the AM and PM peak hours
o Southbound Garden Lane during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o Eastbound and Westbound NH 102 during the AM peak hour
o I-93 Southbound off-ramp during the PM peak hour
- NH 102 at I-93 Northbound on and off-ramp (Exit 4) (Intersection \#8)
o Eastbound NH 102 during the PM peak hour
o I-93 Northbound off-ramp during the AM and PM peak hours
- NH 102 at St Charles Street/Londonderry Road (Intersection \#9)
o Northbound St Charles Street during the PM peak hour
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Northbound Fordway during the AM and PM peak hours
The overall Alternative F intersection LOS grades are depicted in Figure 7-13 for AM and PM peak hours. Table 7-17 shows the comparison between Alternative F and No Build condition LOS capacity analysis and the intersection vehicle delay results during the AM and PM peak hours. Appendices G, H, and I contain the Synchro \({ }^{\mathrm{TM}}\) Build condition intersection analysis reports.

\subsection*{7.16 2040 Build Alternative F Queuing Analysis}

Based on the Synchro \({ }^{\mathrm{TM}}\) signalized intersection analysis results, all the signalized intersections within the study area with the exception of NH 28 at liberty Drive (Intersection \#4), would experience queuing lengths that would exceed the available storage capacity. Intersection \#4 would provide sufficient storage for the anticipated demand. The lane group in the approach that
would operate under unacceptable conditions is noted in parentheses. Table 7-17 contains the queuing results. Appendices J, K, and L contain the Synchro \({ }^{\mathrm{TM}}\) Build condition intersection queuing reports.
- NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1)
o Northbound Vista Ridge Drive (right turns) during the AM and the PM peak hours
o Southbound Symmes Drive (left turns, right turns, and through movements) during the PM peak hour
- NH 28 at I-93 Southbound on and off-ramp (Exit 5) (Intersection \#2)
o Eastbound NH 28 (all movements) during the AM peak hour
- NH 28 at I-93 Northbound on and off-ramp (Exit 5) (Intersection \#3)

0 Eastbound NH 28 (left turns) during the AM and PM peak hours
o Eastbound NH 28 (through movements) during the AM peak hour
o Westbound NH 28 (through movements) during the AM peak hour
- NH 102 at Gilcreast Road (Intersection \#5)
o Eastbound NH 102 (left turns) during the PM peak hour
o Northbound Gilcreast Road (all movements) during the AM and PM peak hours
o Southbound Gilcreast Road (left turns) during the AM peak hour
o Southbound Gilcreast Road (right turns and through movements) during the AM and PM peak hours
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6)
o Westbound NH 102 (right turns) during the PM peak hour
o Northbound Hampton Drive (right turns) during the AM and PM peak hours
o Southbound Garden Lane (all movements) during the AM and PM peak hours
- NH 102 at I-93 Southbound off-ramp (Exit 4) (Intersection \#7)
o I-93 Southbound off-ramp (all movements) during the AM ad PM peak hours
- NH 102 at I-93 Northbound on and off-ramp (Exit 4) (Intersection \#8)
o Westbound NH 102 (right turns) during the AM peak hour
- NH 102 at St Charles Street/Londonderry Road (Intersection \#9)
o Eastbound NH 102 (left turns) during the PM peak hour
- NH 102 at Fordway/Madden Hill Road (Intersection \#10)
o Eastbound NH 102 (through movements) during the PM peak hour
o Eastbound NH 102 (right turns) during the AM and PM peak hours
o Westbound NH 102 (all movements) during the AM and PM peak hours

Intersection \#4 is the only signalized intersection in the traffic study area that would provide sufficient storage for the anticipated demand. The lane group in the approach that would operate under unacceptable conditions is highlighted in red in Table 7-17, which contains a comparison between Alternative F and No Build condition queuing results.

\(\mathrm{EB}=\) Eastbound, \(\mathrm{WB}=\) Westbound, \(\mathrm{NB}=\) Northbound, \(\mathrm{SB}=\) Southbound
LOS = Level of Service
LTR = left / through / right lanes
V/C = Volume-to-Capacity ratio
Delay is Measured in Seconds Per Vehicle.
Red cells denote intersections or approaches operating at unacceptable conditions or denote approaches and lane groups whose queuing length exceeds capacity
\({ }^{\text {a }}\) Highway Capacity Manual 2000 results (Signalized intersections)

\subsection*{7.17 2040 Build 2040 Alternative F Freeway Operations Analysis}

Based on the analysis performed using HCS, one freeway facility would operate above capacity. This includes the I-93 SB off-ramp to NH 102. This facility would fail due to the off-ramp operating over capacity, thus queueing onto the I-93 mainline. The NH 102 on-ramp to I-93 NB would continue to operate above capacity potentially creating a queue into the NH 102 mainline. Table 7-18 contains the Exit 4 Alternative F freeway analysis compared to the No Build condition and Table 7-19 contains the Exit 5 Alternative F freeway analysis compared to the No Build condition. Appendix M contains the Build condition HCS freeway operation reports.

Table 7-19. I-93 Exit 52040 Build Alternative \(F\) freeway analysis compared to the No Build condition

\subsection*{8.0 POLICY ANALYSIS}

\subsection*{8.1 Introduction}

The need for new access from the Interstate stems from overcrowded traffic conditions through downtown Derry, New Hampshire, as well as traffic diverting to local roads to avoid NH 102 through downtown Derry. These conditions are caused by limited east-west routing options for traffic destined to the NH 28 Bypass and points east along NH 102 from origins along I-93 and points west along NH 102. I-93 Exit 4 along NH 102 provides the straightest path but passes through downtown Derry along an urban-designed roadway with on-street parking, frequent intersections, pedestrian accommodations, and dense development. A new connection from the Interstate would support the study goals to remove the pass-through traffic from downtown Derry, creating a safer and more pedestrian friendly downtown while providing a new direct connection to the Londonderry Turnpike and points east.

The following subsections assess the two FHWA policy requirements. The Project study area is defined in Section 2.3, and the purpose and need is defined in Section 1.2.

\subsection*{8.2 Policy Requirement 1: Operational and Collision Analysis}

An operational and safety analysis has concluded that the proposed change in access does not have a significant adverse impact on the safety and operation of the Interstate facility (which includes mainline lanes, existing, new, or modified ramps, and ramp intersections with crossroad) or on the local street network based on both the current and the planned future traffic projections. The analysis should, particularly in urbanized areas, include at least the first adjacent existing or proposed interchange on either side of the proposed change in access (Title 23, Code of Federal Regulations (CFR), paragraphs 625.2(a), 655.603(d) and 771.111(f)). The crossroads and the local street network, to at least the first major intersection on either side of the proposed change in access, should be included in this analysis to the extent necessary to fully evaluate the safety and operational impacts that the proposed change in access and other transportation improvements may have on the local street network (23 CFR 625.2(a) and 655.603(d)). Requests for a proposed change in access should include a description and assessment of the impacts and ability of the proposed changes to safely and efficiently collect, distribute, and accommodate traffic on the Interstate facility, ramps, intersection of ramps with crossroad, and local street network (23 CFR 625.2(a) and 655.603(d)). Each request should also include a conceptual plan of the type and location of the signs proposed to support each design alternative (23 U.S.C. 109(d) and 23 CFR 655.603(d)).

\subsection*{8.2.1 Introduction}

The following subsections describe the future traffic and safety conditions based on five alternatives to demonstrate that alternatives that include a new Exit 4A along I-93 would provide equal or more efficient and safe access to the Londonderry/Derry area than the present condition.

\subsection*{8.2.2 Traffic Volume Summary}

Traffic volumes were compared between the No Build condition and each alternative at five key locations. These include the following locations:
1. NH 102 eastbound and westbound through movements at Fordway/Madden Hill Road (Intersection \#10)
2. NH 28 eastbound through/ northbound right turns and westbound through and right turns at I-93 NB on and off-ramp (Intersection \#3)
3. I-93 northbound and southbound between Exit 4 and Exit 4A
4. I-93 northbound and southbound between Exit 5 and Exit 4A
5. Connector Roadway east of I-93 Exit 4A interchange

\section*{NH 102 Future Travel Patterns}

Based on the comparison of 2040 traffic volume forecasts produced by the SNHPC regional travel demand model, Alternatives A, B, C, and D would reduce traffic along NH 102 and all include a new I-93 Exit 4A interchange. Alternatives A and B would reduce volume by 28 percent along NH 102 when compared to the No Build condition. Alternatives A and B would provide the highest reduction in traffic of the alternatives and would meet the project goal to create a safer pedestrian environment in downtown Derry and reduce diverted traffic off local streets. Alternatives C and D would reduce traffic volume by 24 and 16 percent, respectively, when compared to the No Build condition. These reductions also help reduce traffic along NH 102 through downtown Derry, but not as much as Alternatives A and B. Alternative F would not include a new interchange, but would improvement intersections along NH 102 between I-93 Exit 4 and downtown Derry. These improvements would result in an increase in the vehicle volume by 10 percent which would worsen the traffic levels in downtown Derry.
Table 8-1 presents the NH 102 vehicle volume summary based on the volume of forecasted at location \#1.

Table 8-1. NH 102 vehicle volume summary at Location \#1
\begin{tabular}{|c|c|c|c|c|c|c|c|}
\hline Vehicle Direction & Time Period & No Build & Alt. A & Alt. B & Alt. C & Alt. D & Alt. F \\
\hline \multirow[t]{2}{*}{NH 102 Eastbound Volumes} & AM & 453 & 370 & 360 & 380 & 420 & 540 \\
\hline & PM & 860 & 710 & 680 & 730 & 790 & 1,020 \\
\hline \multirow[t]{2}{*}{NH 102 Westbound Volumes} & AM & 790 & 495 & 545 & 525 & 585 & 810 \\
\hline & PM & 555 & 345 & 345 & 380 & 420 & 555 \\
\hline \multirow[t]{2}{*}{NH 102 Eastbound Average Difference} & AM & & -18\% & -21\% & -16\% & -7\% & 19\% \\
\hline & PM & & -17\% & -21\% & -15\% & -8\% & 19\% \\
\hline \multirow[t]{2}{*}{NH 102 Westbound Average Difference} & AM & & -37\% & -31\% & -34\% & -26\% & 3\% \\
\hline & PM & & -38\% & -38\% & -32\% & -24\% & 0\% \\
\hline \multicolumn{3}{|l|}{Overall Average Difference} & -28\% & -28\% & -24\% & -16\% & 10\% \\
\hline
\end{tabular}

\section*{NH 28 Future Travel Patterns}

Based on the comparison of 2040 traffic volume forecasts produced by the SNHPC regional travel demand model, Alternatives A, B, C, and D would reduce traffic along NH 28.
Alternatives C and D would reduce the volume by more than 44 percent along NH 28 compared to the No Build condition. Of the five alternatives, Alternatives C and D would have the greatest effect on volume, most likely because of the proximity of northern location of the proposed Exit 4A to Exit 5 providing a faster travel time to the same destinations in Londonderry and Derry. Alternatives A and B would reduce traffic volume by 21 and 35 percent, respectively, when compared to the No Build condition. While not as much of a reduction as Alternatives C and D, these reductions would represent a reduction in traffic along NH 28 east of I-93 Exit 5. Alternative F would result in a decrease in the vehicle volume by 3 percent, as a result of improved conditions along NH 102 to access downtown Derry and could represent vehicles shifting to NH 102 rather than remaining on NH 28, which would not achieve the project's goal.
Table 8-2 presents the NH 28 vehicle volume summary forecasted at location \#2.
Table 8-2. NH 28 vehicle volume summary at Location \#2

\section*{I-93 between Exit 4 and 5 Future Travel Patterns}

Based on the comparison of 2040 traffic volume forecasts produced by the SNHPC regional travel demand model, when compared to the No Build condition, Alternatives A, C, and D would reduce traffic along I-93 between Exit 4 and Exit 4A (southern stretch); however, Alternatives A, B, C, and D would increase traffic along I-93 between Exit 5 and Exit 4A (northern stretch). There would be sufficient capacity along this northern stretch of I-93, resulting in no congestion issue with the completion of the I-93 widening to four lanes in each direction. Alternatives C and D would reduce the volume by more than 7 percent along the southern stretch, but increase the volume by 13 percent along the northern stretch. This would represent a shift of vehicles from Exit 4 to Exit 4A from origins from north of Londonderry. Alternatives A and B would result in a similar volume change, a 3 percent decrease and 1 percent increase, respectively for the southern stretch and 10 percent increase for both alternatives along the northern stretch. Alternative A would result in a similar shift from Exit 4 to Exit 4A in vehicle volume from
origins from north of Londonderry. Alternative B would create a new travel pattern by shifting north-south vehicle trips from the NH 28 Bypass to I-93, thereby increasing traffic volumes along I-93 from Exit 4A to points south of Londonderry. Both Alternatives A and B would not shift as many vehicle from Exit 5 to Exit 4A because of the more southern interchange location.
Alternatives A through D resulted in the reduction of vehicle trips forecasted between I-93 Exit 4A and Exit 4 during the PM peak hour. This reduction in vehicle volume eliminates the No Build condition failing I-93 southbound diverge facility serving NH 102. Alternative F does not address this failing facility.
Table 8-3 presents the vehicle summary volume for I-93 between Exit 5 and Exit 4A, and Table 8-4 presents the vehicle volume summary for I-93 between Exit 4 and Exit 4A.

Table 8-3. I-93 between Exit 4 and Exit 4A volume summary at Location \#3

\section*{I-93 Exit 4A Connector Roadway Future Travel Patterns}

Based on the comparison of 2040 traffic volume forecasts produced by the SNHPC regional travel demand model, Alternatives A and B would generate the most volume along the new roadway serving the I-93 Exit 4A interchange. Alternative D would generate the lowest volume of the four alternatives that include the Exit 4A concept. Compared to Alternative D, Alternatives A and B would generate over 46 percent more vehicle trips. The demographic assumptions supporting Alternatives A and B include a full built-out of Woodmont Commons, thus a number of these vehicle trips generated represent Woodmont Commons-destined traffic that would use Exit 4A to access the development through a new planned connection from the Connector Roadway serving Exit 4A.
Table 8-5 contains the I-93 Exit 4A Connector Road vehicle volume summary.
Table 8-5. I-93 Exit 4A Connector Roadway volume summary at Location \#5

\section*{Alternative A Future Traffic Patterns through Downtown Derry}

Select link analysis from the travel demand model was conducted along NH 102 east of Griffin Road (a location at the western end of downtown Derry). The intention of the analysis was to determine how many vehicle trips would be shifted from NH 102 to the new proposed interchange and proposed route to bypass downtown Derry (Table 8-6). Based on the model, under Alternative A there would be a 29 percent decrease in the No Build condition forecasted vehicle volume ( 2,306 vehicles) that would travel through downtown Derry using NH 102. This decrease represents a shift in travel from NH 102 through downtown Derry to the new parallel route serviced by I-93 Exit 4A. At the same time, there would also be a 15 percent increase in the No Build condition forecasted volume (1,205 vehicles) that would travel through downtown Derry using NH 102. This increase represents a shift in travel from another route to NH 102 through downtown Derry because there would be available capacity through downtown Derry. Combining the two changes in travel patterns, there would be a 14 percent decrease in volume ( 1,100 vehicles) that would travel through downtown Derry if Alternative A was implemented.

\subsection*{8.2.3 Traffic Operational and Queuing Analysis-Base Conditions}

The existing traffic operations and queuing conditions are presented in Sections 3.7.4 and 3.7.5. The critical existing areas that experience operation and queueing issues include the following locations (isolated issues would only affect the specific intersections and would not affect adjacent intersections):
- NH 102 at Gilcreast Road (Intersection \#5): operational and queueing issues affecting NH 102 through and turning movements
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6): operational issues affecting NH 102 through and turning movements
- NH 102 at I-93 SB off-Ramp (Intersection \#7): operational issues affecting I-93 SB off-ramp
- NH 102 at I-93 NB On and Off-Ramps (Intersection \#8): operational issues affecting conflicting NH 102 movements (westbound through and eastbound left-turn)
- NH 102 at St. Charles Street/Londonderry Road (Intersection \#9): isolated queuing issues affecting NH 102 eastbound left
- NH 102 at Fordway/Madden Hill Road (Intersection \#10): isolated queuing issues affecting NH 102
In summary, the majority of issues occur along NH 102 at Gilcreast Road (Intersection \#5) where queuing affects Intersection \#6. The Exit 4 intersections have some minor issues, but overall operate well. The two NH 102 intersections east of Exit 4 have minor and isolated issues. There were no issues regarding the NH 28 intersections surrounding Exit 5.

\subsection*{8.2.4 Freeway Analysis-Base Conditions}

The existing freeway facilities all operate at LOS D or better during the AM and PM peak hours; results are presented in Section 3.7.6.

\subsection*{8.2.5 Forecasting Travel Demand for No Build and Build Alternatives}

The future forecasted traffic volumes rely on the SNHPC travel demand model. The development of the No Build condition traffic forecasts is presented in Section 5.3, and the Build alternatives are presented in Section 6.0. Both sets of forecasts rely on changes to the model network at 30 locations and reflect roadway improvements and different demographic forecasts. The demographic forecasts used for the No Build condition were also used for Alternative F. Alternatives C and D have similar projections reflecting some growth beyond the No Build level based on a proposed, more northern location of the I-93 Exit 4 interchange. Alternatives A and B also have similar projections reflecting the maximum induced growth potential based on the location of the proposed, more southern location of the I-93 Exit 4A interchange and its relation to the proposed Woodmont Commons PUD. Section 3.1 provides the detailed demographic descriptions assigned to each future alternative and No Build condition.

\subsection*{8.2.6 Traffic Operational and Queuing Analysis - Future Base Conditions for 2040 (Future Year)}

The future No Build condition operations and queuing conditions are presented in Sections 5.4 and 5.5. The critical areas that would experience operation and queueing issues include the following locations (isolated issues would only affect the specific intersections and would not affect adjacent intersections):
- NH 28 at Symmes Drive/Vista Ridge Drive (Intersection \#1): isolated operational issues affecting NH 28 turning movements
- NH 28 at I-93 SB On and Off-Ramps (Intersection \#2): operational and queueing issues affecting NH 28 through and turning movements and I-93 SB off-ramp
- NH 28 at I-93 NB On and Off-Ramps (Intersection \#3): operational and queueing issues affecting NH 28 through and turning movements and I-93 NB off-ramp
- NH 102 at Gilcreast Road (Intersection \#5): operational and queueing issues affecting NH 102 through and turning movements
- NH 102 at Hampton Drive/Garden Lane (Intersection \#6): operational issues affecting NH 102 through movements
- NH 102 at I-93 SB off-Ramp (Intersection \#7): operational issues affecting NH 102 through and turning movements and I-93 SB off-ramp
- NH 102 at I-93 NB On and Off-Ramps (Intersection \#8): operational issues affecting NH 102 through and turning movements and I-93 NB off-ramp
- NH 102 at St. Charles Street/Londonderry Road (Intersection \#9): isolated operational issues affecting NH 102 through and turning movements
- NH 102 at Fordway/Madden Hill Road (Intersection \#10): isolated operational and queuing issues affecting NH 102
In summary, the majority of issues would occur along NH 28 at Exit 5 (Intersections \#2 and \#3) and NH 102 between Gilcreast Road (Intersection \#5) and I-93 NB on- and off-ramps
(Intersection \#8) affecting the Exit 4 intersections along NH 102. The two NH 102 intersections east of Exit 4 would have minor, isolated issues.

\subsection*{8.2.7 Freeway Analysis - Future Base Conditions for 2040 (Future Year)}

The future No Build condition freeway facilities all operate at LOS D or better during the AM and PM peak hours except for the I-93 SB diverge at Exit 4, which operates at LOS F. In addition, the I-93 NB on-ramp from NH 102 at Exit 4 would operate above its capacity. This would create a queue that might extend back into NH 102 at Intersection \#8. These results are presented in Section 5.6.

\subsection*{8.2.8 Traffic Operational and Queuing Analysis - 2040 Build Alternatives}

\section*{Future Build Traffic Operations}

The study analyzed 12 intersections under each alternative covering the study area. For each alternative, including the No Build condition, the traffic signal timings were optimized and the offsets were also optimized to process vehicle platoons as best as possible and reduce queuing as much as possible. Based on the analysis when compared to the No Build condition, the following would occur:
- Intersections east and west of Exit 5 along NH 28 (Intersections \#1 and \#4) would remain the same or improve for all alternatives.
- Intersections serving Exit 5 along NH 28 (Intersections \#2 and \#3) for the most part improve; however, Intersection \#3 worsens operationally under Alternative A and Intersection \#2 remains the same under Alternative F.
- Intersections west of Exit 4 along NH 102 (Intersections \#5 and \#6) would maintain the same LOS or worse because of the projected increase in vehicle volume attracted to the Woodmont Commons development, accessible from Garden Lane and Gilcreast Road.
- Intersections serving Exit 4 along NH 102 (Intersections \#7 and \#8) would improve for Alternatives B and F, but remain the same or worsen for the other alternatives. The worsening conditions at these locations result from the generation of vehicle trips from Woodmont Commons to access the I-93 NB on-ramp and from the I-93 NB offramp to access Woodmont Commons.
- Intersections east of Exit 4 along Exit 102 (Intersections \#9 and \#10) would improve because the proposed improvements at Intersections \#9 for all alternatives and projected decrease in volumes along NH 102 east of Exit 4 for Alternatives A, B, C, and D .
- Intersections serving the I-93 Exit 4A interchange would operate at LOS D or better for all alternatives that include that component (Alternatives A, B, C, and D).
Table 8-7 provides an operational summary. The cells shown in red highlight LOS E or F operation, and cells shown in orange highlight worsening conditions when compared to the No

Table 8-7. Future intersection operations summary

Red denotes overall failing operations (LOS E or F).
7 Orange denotes cases where the alternative operation would be worse than the No Build condition.

\section*{Future Build Traffic and Queuing Assessment}

The future Build condition operations and queuing conditions are presented in Sections 7.3 through 7.16. Based on a comparison between the No Build condition and the alternatives, the following can be deduced:
- Alternatives B and C impacted one intersection (Intersection \#6 only)
- Alternative D impacted two intersections (Intersections \#5 and \#6)
- Alternative A impacted two intersections (Intersections \#6 and \#8)
- Alternative F impacted four intersections (Intersections \#2, \#3, \#7, and \#10)
- Alternative A benefited five intersections (Intersections \#2, \#5, \#7, \#9, and \#10)
- Alternative B benefited seven intersections (Intersections \#2, \#3, \#5, \#7, \#8, \#9, and \#10)
- Alternatives C and D benefited six intersections (Intersections \#2, \#3, \#7, \#8, \#9, and \#10)
- Alternative F benefited one intersection (Intersection \#9)

Table 8-8 contains a comparison of intersection analysis between Build alternatives.
Based on the Woodmont Commons Memorandum of Understanding, to "unlock" parcels within the PUD Master Plan for the developer to continue construction, the developer must submit a traffic study to the Londonderry Planning Board to ascertain the level of roadway mitigation necessary to handle the new vehicle trips generated (Pillsbury, 2018). The assessment in this study does not include the future mitigation because the future mitigation is not known until the next set of Woodmont Commons traffic studies are completed. Because it is assumed that Alternatives A and B would induce a fully built out Woodmont Commons PUD, two traffic issues occurred as follows:
- The number of vehicle trips generated through the study area was based on a fully builtout Woodmont Commons PUD.
- The appropriate level of traffic mitigation was not in place to address the forecasted vehicle trips generated by the Woodmont Commons PUD.

The resulting issue was traffic impacts along NH 102 at Exit 4 (Intersections \#7 and \#8), NH 102 at Garden Lane/Hampton Drive (Intersection \#6), and NH 102 at Gilcreast Road (Intersection \#5). These traffic issues should be assumed to be addressed by the future traffic studies prepared to "unlock" Woodmont Commons PUD parcels.

\end{tabular}

Oper. = Operations
Red under No Build denotes overall failing operations (LOS E or F) or the vehicle queue is projected to extend beyond available storage space.
4 Red under all other alternatives denotes worse conditions than the No Build Condition.
5 Green under No Build denotes overall acceptable conditions.
6 Green under all other alternatives denotes better condition than the No Build Condition.

The proposed new intersections to serve the I-93 Exit 4A interchange ramp termini would both operate at LOS D or better for all alternatives that include the Exit 4A component. Alternatives A, C, and D would result in minor queuing; however, Alternative B would create the longest queues mainly because this alternative would attract the most vehicle trips.

\subsection*{8.2.9 Freeway Analysis - 2040 Build Alternatives}

The study analyzed 13 freeway facilities under each alternative covering the study area (Table \(8-9\) ). Based on the analysis, the I-93 southbound off-ramp to NH 102 would continue to operate at LOS F under Alternative F. All other freeway facilities under all alternatives would operate at LOS D or better. The future Build condition freeway facilities including the I-93 Exit 4A interchange would operate as follows:
- All facilities would operate at LOS D or better for Alternative A.
- All facilities would operate at LOS D or better for Alternative B; however, the I-93 NB on-ramp would operate above its capacity, thus creating a queue that might extend back into NH 102 at Intersection \#8.
- All facilities would operate at LOS D or better for Alternative C.
- All facilities would operate at LOS D or better for Alternative D.
- The I-93 SB diverge at Exit 4 would continue to operate at LOS F and the I-93 NB on-ramp would operate above its capacity, thus creating a queue that might extend back into NH 102 at Intersection \#8.

These results are presented in Sections 7.5, 7.8, 7.11, 7.14, and 7.17.

2 Red denotes overall failing operations (LOS E or F).

\subsection*{8.2.10 Collision Analysis - Base Conditions}

A crash analysis was performed covering the study area and included the intersections along NH 28 and NH 102 as well as I-93 between Exits 4 and 5 (see Section 3.8). This section discusses the crash types, speculates regarding the reasons for the crashes, and reviews the crash severity.

\section*{Types of Collision Occurring}

At the intersections, crash types included rear end, angle, side swipes, head-on, fixed objects in the road, fixed object off the road, pedestrian, and other. The rear end collisions represent one vehicle hitting another directly in front. These are usually caused by a vehicle stopping abruptly and the vehicle directly behind unable to stop fast enough to avoid a collision. These can also occur when both vehicles are traveling above the speed limit and trailing vehicle is driving too close, thus reducing the amount of space necessary to avoid the collision. These types of crashes can also be caused by the driver in the trailer vehicle using their mobile phone and not paying attention to the road.

Angle collisions can be caused by one vehicle not yielding to another when entering a lane on a roadway. In most cases, the vehicle already in the lane has the ROW and another vehicle aggressively enters the lane at an intersection.

Side swipe crashes are similar to angle collisions except these crashes occur when one vehicle changes lanes on the same roadway and does not yield to a vehicle already in that lane. These crashes occur often due to blind spots in a vehicle where the drive cannot see if the adjacent lane is clear.

Head-on crashes can occur in a number of instances such as, if a driver enters a roadway headed in the wrong direction and does not realize their mistake until another vehicle appears. They can also occur when a vehicle enters a reversible lane that is closed.

The other crash types are similar in that they can occur at any time based on the weather, not paying attention to the road, speeding, or failure of the vehicle to operate correctly. These crash types do not involve another vehicle.

Based on the crash data provided by NHDOT, the most prevalent crash type along NH 28 and NH 102 were rear end, followed by angle collisions. There were also a number of side swipes. The intersections with the highest crash rates (all exceeded 1.0 MEV) and highest number of injuries were all along NH 102 and included Gilcreast (Intersection \#5), Garden Lane/Hampton Drive (Intersection \#6), and I-93 NB Ramps (Intersection \#8). Tables 3-14 and 3-15 summarize the intersection crash analysis.

Along the freeway, there were slightly different crash types reported. These included fixed object, other motor vehicle, parked vehicle, overturns, jackknife, other object, and other. A fixed object crash involved a vehicle hitting a sign, guard rail, lamp post, tree, or barrier. Other motor vehicle refers to one moving vehicle crashing into another moving vehicle in a sideswipe manner. A parked vehicle refers to a moving vehicle hitting a vehicle parked along the shoulder. Overturns means a vehicle was traveling much faster than the speed limit and flipped over, which would involve some dangerous driving. Jackknife refers to trucks turning beyond the radius designed by the vehicle and the trailer separating from the cab.

Based on the crash data provided by NHDOT, crashes with other motor vehicles were the most common, followed by crashes with fixed objects. There were a number of overturned vehicles
mostly along the I-93 mainline between Exits 4 and 5. The freeway location with the highest crash rate and highest number of injuries was I-93 NB between Exits 4 and 5. The area with the second highest crash rates was the I-93 SB merge at Exit 4. Tables \(3-16\) and \(3-17\) summarize the freeway crash analysis.

\section*{Reasons for Collisions}

Crash data helps to point to possible causes for the crashes, but without reviewing each crash report prepared by the state police, the study can only infer what might be causing the crashes.

Based on the intersection data, most of the crashes occurred during the daylight hours, on clear weather days, and in dry pavement conditions. This would point to driver distraction and speeding and to a lesser extent driver error at NH 102 at Gilcreast, NH 102 at Garden Lane/Hampton Drive, and NH 102 at I-93 NB ramps (Intersections \#5, \#6, and \#8) mainly because the roadway is flat, the signing indicates the lane geometry ahead of intersections, there is a clear view of the intersection on approach, and the traffic signal is visible from all lanes. There are also a number of crashes that fell into the "other" category, which does not help to identify the reason for the crash.

Based on the freeway data, most of the crashes occurred during the daylight hours, on clear weather days, and in dry pavement conditions. There were some crashes (approximately 20 percent) that did occur at night and in winter weather conditions This would point to driver distraction, speeding, and to a lesser extent weather conditions along I-93 NB and SB between Exit 4 and 5 mainly because the road is flat, signing warns of upcoming interchange ramps, and the roadway either is straight or has large radius turns (gentle turns). I-93 SB at Exit 4 does have multiple on-ramps from NH 102, which results in a slightly higher crash rate along the stretch of I-93 between the two merges. Both of these facilities still result in low crash rates with 0.24 and 0.20 MEV, respectively. A few crashes along I-93 resulted in overturned vehicles. Based on the data, these crashes primarily occurred during the day in dry conditions, which further supports speeding as the cause of the crashes.

\section*{Severity of Collisions}

The severity of collisions can be assessed based on the collision type, number of injuries, and number of fatalities. Based on the intersection data, very few crashes were head-on or involved pedestrians. There was one fatality at NH 102 and I-93 NB ramps (Interchange \#8). Based on the freeway data, most crashes were not severe, but there were some overturned vehicles and one jackknifed tractor trailer. None of the crashes resulted in a fatality.

\subsection*{8.2.11 Collision Analysis - 2040 Build Alternatives}

The future conditions would include roadway improvements beside the construction of the I-93 Exit 4A interchange. These would include the following five improvements:
1. I-93 Mainline would be widening from two to four lanes in each direction through the study area (currently under construction).
2. The I-93 Exit 4 ramps and NH 102 alignment would be reconstructed to include more turning lanes at the intersections (Intersections \#7 and \#8) and more through lanes along NH 102 (currently under construction).
3. The intersection of NH 102 and Gilcreast (Intersection \#5) would be reconstructed to include more through lanes along NH 102 (proposed future Woodmont Commons mitigation).
4. The intersection of NH 102 and Garden Lane/Hampton Drive (Intersection \#6) would be reconstructed to include more through lanes along NH 102 (proposed future Woodmont Commons mitigation).
5. The intersection of NH 102 and Londonderry Road/St. Charles Street (Intersection \#9) would be reconstructed to include more turning lanes along NH 102 (Proposed future Woodmont Commons mitigation).
In addition to these five ongoing and future improvements, NHDOT recently improved the I-93 Exit 5 interchange and adjacent intersections along NH 28 at Symmes Drive/Vista Ridge and Liberty Drive (Intersections \#1 \#4). Together, these future and ongoing improvements would cover all IJR study area intersections with the exception of NH 102 and Fordway/Madden Hill Road (Intersection \#10).
These roadway improvement would be based on the latest designs and would follow all applicable American Association of State Highway Transportation Officials (AASHTO), NHDOT, and FHWA guidelines to ensure they address any safety issues and do not create any new ones. The design of I-93 Exit 4A would also follow the latest AASHTO, NHDOT, and FHWA guidelines to ensure the ramps merges and diverges provide adequate distances, the intersections serving the new connector roadway provide proper lane geometry, and traffic signals serving the new intersections can be seen by approaching vehicles.

Any past safety concerns evident from crash data would be assumed to be addressed through the improvement projects. In terms of driver speeding and distracted driver issues, two counter measures could be implemented. NHDOT could install automated speed enforcement cameras to reduce speeding (FHWA, n.d.a). Prior to investing in enforcement cameras, a speed study should be conducted to confirm that the 85th percentile speed is well over the speed limit. For distracted driving, New Hampshire has published is own Net Zero Plan that includes a number of strategies to address distracted drivers. These strategies include (FHWA, n.d.b):
- Education through action plans and local and national campaigns, and exposing young drivers to presentations on the topic
- Enforcement/adjudication through targeted enforcement times and places as well as asking officers to identify the distraction on the crash reports
- Engineering by installing rumble strips
- Legislative policy/programmatic measures to promote strong laws against distracted driving and developing and implementing action plans to focus drivers

\subsection*{8.2.12 Policy Requirement 1 Conclusion}

The proposed five alternatives in tandem with the planned roadway improvements each provide a different level of operation, queueing, and safety impacts and benefits. The overall impacts under Alternatives A and B assume Woodmont Commons follows its memorandum of understanding with the Town of Londonderry and implements traffic improvements along NH 102.

Five alternatives and the No Build condition were analyzed to assess if a new interchange is warranted to address the study goals. The No Build condition and Alternative F represent improvements to NH 102 that do not include a new I-93 Exit 4A interchange; therefore, assessment of these alternatives considers using the existing roadway system to address study goals. Based on the forecasted changes in vehicle trip patterns through downtown Derry (see Table 8-1), Alternative F and the No Build condition would not address the goal of reducing pass-through vehicle volumes.

Alternatives A, B, C, and D would each include a new I-93 Exit 4A interchange and a connector roadway to link the interchange to eastern Derry via either a new alignment or improvements to existing alignments. Alternatives A and B would create a new interchange and would serve adjacent developable lane, thus they also include the assumption that induced and background growth would occur in the area. Alternatives C and D would create a new interchange that does not serve adjacent developable land, thus would only include background growth. Therefore, the SNHPC travel demand model created additional vehicle trips in the study area destined to the specific growth areas depending on the alternative. For Alternatives A and B, these growth areas include Woodmont Commons (full build-out) and other smaller developments in Derry, Londonderry, Auburn, Chester, and Sandown. The Woodmont Commons and other background growth vehicle trips were added to freeway facilities and intersections along NH 102 and NH 28. Alternatives C and D only include growth in Chester and Sandown and maintain Woodmont Commons at the same growth level as the No Build condition.
Based on the analysis, the study area freeway facilities would all operate at acceptable levels for Alternatives A, B, C, and D (see Table 8-9). Each alternative would result in a different number of intersections that would operate at worse conditions (operations not queueing) when compared to No Build condition as follows:
- Under Alternative A, four intersections (one along NH 28 and three along NH 102)
- Under Alternative B, one intersection along NH 102
- Under Alternative C, three intersections along NH 102
- Under Alternative D, four intersections along NH 102
- Under Alternative F, none

The proposed trips generated by Woodmont Commons account for most of these intersection issues under Alternatives A and B because these alternatives include the maximum generation of trips under the full build-out scenario. These trips would be added to NH 102 and NH 28 as well as to Exit 4A and the I-93 mainline.

\section*{Alternative A Conclusions}

Based on the analysis of trip patterns from the SNHPC travel demand model, Alternative A would provide a more parallel route to bypass downtown Derry and connect I-93 and eastern Derry. Alternative A would result in more east-west regional trips using the new I-93 Exit 4A interchange, which would then disperse between Exits 4 and 5 to reach destinations to the west along NH 102 and NH 28. Alternative A would improve I-93 freeway operations at Exit 4, intersection operations at one location along NH 28 and four locations along NH 102, and queueing issues at two locations along NH 28 and three location along NH 102. Therefore, this alternative would resolve the intersection's operation, queuing, and freeway operation issues and
would not significantly affect the safety and operation of the interstate facility. This alternative would also properly collect, distribute, and accommodate traffic between the freeway and proposed new connector roadway as well as Exits 4 and 5 . The results do show adverse impacts to three IJR study area intersections, but these will be addressed by the Woodmont Commons traffic mitigation requirements imposed by Londonderry.

\section*{Alternative B Conclusions}

Alternative B would create a new direct connection to areas northeast of downtown Derry. Based on the travel patterns reported from the model, this new connection would attract more northsouth regional trips by shifting vehicles from the NH 28 Bypass to I-93 because the travel time to access I-93 would drop with the Alternative B alignment. The trips destined to locations south of Derry and Londonderry would use I-93 rather than the NH 28 Bypass starting from the new I-93 Exit 4A interchange. The model also indicates that Alternative B would have more downtown Derry pass-through trips than Alternative A. Alternative B would not improve I-93 freeway operations at Exit 4, but would improve intersection operations at one location along NH 28 and five locations along NH 102, and queueing issues at two locations along NH 28 and three location along NH 102. Therefore, this alternative would resolve the intersection operations and queuing issues along NH 102 and NH 28; however, it would also continue to significantly affect the safety and operation of the I-93 NB on-ramp from NH 102. This would cause safety issues with traffic trying to access the freeway from NH 102. Queuing issues at the ramp termini serving Exit 4A would also occur, but these issues could be addressed through the ramp designs. The freeway mainline would not be significantly affected under Alternative B as long as the offramps provide enough space to store the forecasted queuing lengths. The results do show an adverse impact to one IJR study area intersection, but this will be addressed by the Woodmont Commons traffic mitigation requirements imposed by Londonderry.

\section*{Alternatives C and D Conclusions}

Alternative C and D provide variations to Alternatives A and B in terms of the connection route between I-93 and eastern Derry. These alternatives would include a new proposed interchange in a more northern location; therefore they would not create the best parallel route to downtown Derry. They would create more of a bypass to NH 28 between I-93 Exit 5 and where NH 28 intersects the two alignments, would attract more vehicle trips from NH 28 than NH 102, and would attract far fewer trips to Exit 4A than Alternatives A and B. Alternatives C and D would improve I-93 freeway operations at Exit 4, intersection operations at one location along NH 28 and four locations along NH 102, and queueing issues at two locations along NH 28 and three location along NH 102. Therefore, these alternatives would resolve the intersection’s operation, queuing issues along NH 102 and NH 28, and freeway operation issues and would not significantly affect the safety and operation of the interstate facility. These alternatives would also properly collect, distribute, and accommodate traffic between the freeway and proposed new connector roadway as well as Exits 4 and 5.

\section*{Alternative F and No Build Conclusions}

Alternative F and the No Build would minimally change vehicle trip patterns. Under Alternative F, freeway impacts would continue to occur at the I-93 SB off-ramp to NH 102 and minimal improvement to IJR study area intersection operations and queueing would occur. Therefore, these alternatives would not resolve intersection operation, queuing, and freeway operation
issues and would continue to adversely affect the safety and operation of the freeway. Failing freeway facilities would cause queuing onto the I-93 mainline and NH 102 and failing intersections would exist at the ramp termini of Exits 4 and 5.

\section*{Overall Conclusions}

Based on the goal to reduce through trips traveling through downtown Derry, Alternatives A, B, C , and D would address the policy requirement and Alternatives F would not address the policy requirement. Alternative A would provide the best connection of the five alternatives because it would directly parallel downtown Derry and could handle the design year traffic demands, especially the freeway operations. Some intersections along NH 28 and NH 102 would be affected, but a number of those trips would be directly related to the forecasted trips generated by the Woodmont Commons development. Section 8.2.1 describes the Woodmont Commons PUD process to incrementally perform traffic studies to construct infrastructure improvements, if necessary, to mitigate any future proposed development following the Woodmont Commons PUD Master Plan.

\subsection*{8.2.13 Conceptual Sign Plan}

A conceptual sign plan has not been prepared for the proposed alternative designs. It is assumed that once a preferred alternative is identified through the NEPA process and the project moves forward into the design process, a sign plan would be created following the NHDOT and Manual Uniform Traffic Control Devices guidelines to properly alert drivers of the interchange connections, exit locations, entrance locations, ramp speeds, ramp direction (do not enter signs at the end of the ramp), and lane geometry at the ramp termini intersections.

\subsection*{8.3 Policy Requirement 2: Access Connections and Design}

The proposed access connects to a public road only and will provide for all traffic movements. Less than "full interchanges" may be considered on a case-by-case basis for applications requiring special access, such as managed lanes (e.g., transit or high occupancy vehicle and high occupancy toll lanes) or park and ride lots. The proposed access will be designed to meet or exceed current standards (23 CFR 625.2(a), 625.4(a)(2), and 655.603(d)). In rare instances where all basic movements are not provided by the proposed design, the report should include a full-interchange option with a comparison of the operational and safety analyses to the partial-interchange option. The report should also include the mitigation proposed to compensate for the missing movements, including wayfinding signage, impacts on local intersections, mitigation of driver expectation leading to wrong-way movements on ramps, etc. The report should describe whether future provision of a full interchange is precluded by the proposed design.

\subsection*{8.3.1 Introduction}

The four build alternatives that include a new I-93 Exit 4A interchange have similar designs. The designs follow a standard diamond interchange containing four ramps, two intersections, and a single bridge crossing the Interstate. The spacing for the proposed interchanges places the new interchange over a mile to Exit 4 or Exit 5.

\subsection*{8.3.2 Conceptual Layout}

Alternatives A and B include the design of the same interchange approximately 1.25 miles north of Exit 4. The interchange follows a typical diamond interchange design with four ramps, two off-ramps, and two on-ramps, each with adequate space for merging and diverging providing all connections between I-93 and the new connector road. The SB off-ramp would contain two lanes extended to the diverge with I-93 because of the forecasted volume, while the three other ramps would contain one lane. The proposed diamond interchange is the most common interchange configuration and would allow traffic to enter and leave at relatively high speeds (AASHTO, 2011). The ramps would not become new lanes along I-93 but would terminate after providing merging and diverging space. The new connector roadway would contain two intersections, one serving I-93 NB ramps and one serving I-93 SB ramps. A new bridge would be constructed to connect the intersections. The new connector roadway would provide a connection to the Londonderry local roadway network and NH 28 to the east. Figure 8-1 shows the Alternative A and B current interchange design.
Alternatives C and D include a similar diamond interchange design as Alternatives A and B , approximately 1.5 miles south of Exit 5. Figure 8-2 shows the Alternative C and D current interchange design.
These designs both exclude a connection to the west. Alternatives A and B would, therefore, directly connect to the future planned Woodmont Commons PUD development on the eastern side of I-93. Alternatives C and D would not provide a direct connection and instead would connect directly to NH 28. The Woodmont Commons PUD development planned for the western side of I-93 would be accessible from Exit 4A via Ash Street and Pillsbury Road.

Figure 8-1. Alternatives \(A\) and \(B\) interchange designs

1

Figure 8-2. Alternatives \(\mathbf{C}\) and D interchange designs

\subsection*{8.3.3 Present and Future Interchange Spacing}

The existing spacing between Exit 4 and Exit 5 is 3.55 miles. Under Alternatives \(A\) and \(B\), the proposed interchange spacing between Exit 4 and Exit 4A would be 1.25 miles and between Exit 4A and Exit 5 would be 2.3 miles. Under Alternatives C and D, the proposed interchange spacing between Exit 4 and Exit 4A would be 2.05 miles and between Exit 4A and Exit 5 would be 1.5 miles.

According to the Policy on Geometric Design of Highways and Streets, the typical rule of thumb to follow is 1 mile between interchanges in urban areas and 3 miles in rural areas (AASHTO, 2011). In this case, the location is currently suburban in nature and will continue to become more urbanized in the future with additional population and employment growth projected for 2040; therefore, the proposed spacing for either interchange location would exceed the 1-mile minimum threshold.

\subsection*{8.3.4 Policy Requirement 2 Conclusion}

The proposed design meets the most common interchange design, and interchange spacing would meet minimum thresholds. The interchange would provide access to parcels to the east of the interchange with connections to NH 28 and points east. Therefore, the proper access would be provided and the interchange design would follow the latest design standards. Before the design is finalized, FHWA would have an opportunity to review.

\section*{1}

2

\subsection*{9.0 SUMMARY}

The proposed I-93 Exit 4A interchange would provide an overall benefit to the Londonderry/ Derry area and addresses FHWA's two requirements. Alternative A addresses a number of evaluation factors introduced in Section 4.0, including traffic and accessibility. Table 9-1 summarizes the evaluation criteria presented in Section 4.0 with the preliminary results.

\section*{Table 9-1. Preliminary evaluation criteria assessment summary}
\begin{tabular}{|l|l|l|l|l|l|l|}
\hline \multicolumn{1}{|c|}{ Criteria } & No Build & \multicolumn{1}{c|}{ Alternative A } & \multicolumn{1}{c|}{ Alternative B } & \multicolumn{1}{c|}{ Alternative C } & \multicolumn{1}{c|}{ Alternative D } & Alternative F \\
\hline Traffic & & \(\begin{array}{l}\text { No } \\
\text { Improves all freeway } \\
\text { and most } \\
\text { intersection } \\
\text { operations/queuing } \\
\text { issues }\end{array}\) & \(\begin{array}{l}\text { Improves all freeway } \\
\text { and most } \\
\text { intersection } \\
\text { operations/queuing } \\
\text { issues; does not } \\
\text { address one on- } \\
\text { ramp capacity issue }\end{array}\) & \(\begin{array}{l}\text { Improves all freeway } \\
\text { and intersection } \\
\text { queuing; improves } \\
\text { most intersection } \\
\text { queuing issues }\end{array}\) & \(\begin{array}{l}\text { Improves all freeway } \\
\text { and most } \\
\text { intersection } \\
\text { operations/queuing } \\
\text { issues }\end{array}\) & Minimal Change
\end{tabular}\(\}\)

The IJR study provided an assessment of the existing conditions, future baseline conditions (No Build condition), and future Build based on five alternatives. The future conditions (No Build and Build) were evaluated based on a quantitative traffic operations, queueing, and volume shift assessment as well as a crash data analysis covering the freeway and NH 28/NH 102. The IJR study integrated the various assessments to answer each of the FHWA policy requirements. The following is a summary of the findings for each policy requirement:
1. Operational and Collision Analysis: Alternatives A, B, C and D would not adversely impact the traffic and safety issues along the I-93 freeway as well as NH 102 and NH 28. This includes queuing issues along the ramps serving I-93, the ramp termini intersections at NH 102 and NH 28, and other intersections within the IJR study area. Traffic would also be properly distributed between the different roadway classifications (freeway to ramps to principal arterials to collectors to local roadways).
2. Access Connections and Design: Alternatives A, B, C, and D would all meet minimum interchange spacing thresholds and follow typical interchange design standards established in the AASHTO design manual.

Table 9-2 contains the FHWA policy requirement assessment summary and provides a rating to indicate if the alternative would address the policy requirement. Green indicates the alternative would fully address the policy rating, orange means the alternative would partially address the policy rating, and red means the alternative would minimally address the policy requirements.

Re: Farmland Conversion Impact Rating for the l-93 Exit Aa Interchange Study in Derry and Londonderry, NH

Dear Ms. Paris,
The Farmland Conversion Impact rating has been completed based on your correspondence of February 17, 2006. I am forwarding a completed Form NRCS-CPA-106, Farmland Conversion Impact Rating for Corridor Type Projects. All areas impacted by the project are either designated as urbanized areas by the U.S. Census Bureau or soils that are not prime, statewide or locally important. Therefore, this project is not subject to FPPA and no further action is required.

If you have any questions, please do not hesitate to contact me.

Katherine Swain

\section*{External}

Peter,
Attached is the completed and signed Farmland Conversion Impact Rating Form for the project. The total point score for the Selected Corridor (Alternative A) is less than 160, as such the project is in full compliance with the FPPA.

Thank you for your assistance.

If you have any questions or comments, please contact me.

Marc

To: Laurin, Marc
Subject: RE: Derry-Londonderry, 13065 - Farmland Conversion Impact Rating Form
Marc,
Parts II, IV, and V of form CPA-106, the Farmland Conversion Impact Rating For Corridor Type Projects (attached) have been completed. The Relative Value of each alternative corridor is 34 or less. Please note that Alternative A does not include any land that is Prime, Statewide or Locally Important Farmland, and therefore is not subject to the Farmland Protection Policy Act. Also attached is the soil map of the area and a Farmland Classification map.

Please fill out Parts VI and VII. If the total point score is 160 or less, then the project is in full compliance with FPPA and no further action is required. If the total point score is above 160 points, then alternative design or location should be considered that might reduce the total point score. If this is not possible, then an explanation should be provided in Block 5 at the bottom of the form. Additional information about completing the form and the Farmland Protection Policy Act can be found at the following web site: http://www.nrcs.usda.gov/wps/portal/nrcs/main/national/landuse/fppa/.

Please provide a final copy of the completed CPA-106 to me for NRCS records and retain a copy for your records, regardless of the total point score.

If you have any questions, please feel free to contact me.

\subsection*{1.0 INTRODUCTION}

The I-93 Exit 4A Project (Project) is proposed by the Towns of Derry and Londonderry and the New Hampshire Department of Transportation (NHDOT), in cooperation with the Federal Highway Administration (FHWA). A Supplemental Draft Environmental Impact Statement (SDEIS) is being prepared for the project. The proposed project meets the definition of a Type I project under FHWA's noise regulation (23 CFR 772) because it involves a new interchange and connector roadway. Therefore, a traffic noise study is required to identify noise-sensitive land uses, model traffic noise impacts, and evaluate noise abatement measures for impacted receptors.
As part of this study, the need for and design of noise barriers along the I-93 mainline within the project area has been reevaluated in light of the Exit 4A, specifically for receptors along Trolley Car Lane on the west side of I-93, and along Seasons Lane on the east side of I-93. Noise barriers were designed for these locations as part of the I-93 widening, but these barrier designs do not take into account the location of the Exit 4A ramps and associated fill.

\subsection*{1.1 Project Alternatives}

The purpose of the Project is to reduce congestion and improve safety along NH 102, from I-93 east through downtown Derry and to promote economic vitality in the Derry/Londonderry area. Five build alternatives are under consideration as summarized below. Alternative A is the preferred alternative identified in the SDEIS. As shown in Figure 1-1, Alternatives A and B share a common new interchange location approximately 1.5 miles north of Exit 4 (referred to as the southern interchange location), as do Alternatives C and D approximately 2 miles north of Exit 4 (northern interchange location). All the new interchange alternatives (A, B, C and D) involve construction the new connector roadway on a bridge over I-93. For detailed mapping of the alternatives, refer to Chapter 3 of the SDEIS.

\section*{Alternative A}

Alternative A (the preferred alternative) includes a corridor that is approximately 3.2 miles in length between the new proposed I-93 Exit 4A interchange and eastern Derry. There would be approximately 1 mile of roadway construction on a new alignment, 1.6 miles of existing roadway reconstruction, and 0.6 miles of roadway with no improvements. It would originate from the southern I-93 Exit 4A interchange location and travel northeast along new alignment through a wooded area to Folsom Road, near its intersection with North High Street and Madden Road. This alternative would continue to follow Folsom Road past Ross' Corner (Manchester Road/NH 28) and continue on Tsienneto Road across NH 28 Bypass to its end at NH 102, adjacent to Beaver Lake.

\section*{Alternative B}

The Alternative B corridor is approximately 3.4 miles in length between the new proposed I-93 Exit 4A interchange and eastern Derry. The entire 3.4-mile corridor would consist of roadway construction on new alignment. It would originate from a new southern I-93 Exit 4A interchange and travel northeast along a new alignment through a wooded area to the intersection of Ashleigh Drive and NH 28. From this intersection, this alternative would extend northeast towards the intersection of London Road and NH 28 Bypass and then continue on new alignment to the intersection of Tsienneto Road and NH 102.

\section*{Alternative C}

The Alternative C corridor is approximately 3.7 miles in length between the new proposed I-93 Exit 4A interchange and eastern Derry. Approximately 2.9 miles of corridor would be on new alignment, while approximately 0.8 miles would reconstruct existing roadways. The alternative would start from a new northern I-93 Exit 4A interchange and travel east approximately 0.7 miles along a powerline ROW to NH 28. Following NH 28 south to the intersection of Ashleigh Drive, it would follow the same alignment as Alternative B to the intersection of Tsienneto Road and NH 102.

\section*{Alternative D}

The Alternative D corridor is approximately 3.9 miles in length between the new proposed I-93 Exit 4A interchange and eastern Derry. Within this corridor, approximately 0.8 miles would be on new alignment, 2.5 miles on existing roadways would be reconstructed, and 0.6 miles would have no improvements. The alternative would commence from a new northern I-93 Exit 4A interchange and travel east approximately 0.7 miles along a powerline ROW to NH 28. Following NH 28 south to Ross' Corner, the corridor would then follow the same path as Alternative A to the intersection of Tsienneto Road and NH 102.

\section*{Alternative F}

Alternative F focuses all improvements along the existing NH 102 corridor between Exit 4 at I93 and downtown Derry. A two-way, center, left-turn lane would be constructed from Londonderry Road to NH Route 28, and improvements would be made to existing intersections. The majority of existing on-street parking spaces would be lost to accommodate the center turn lane. The corridor would be 1.7 miles long, with the entire corridor consisting of roadway reconstruction (i.e., there is no portion on new alignment).

Figure 1-1. Project Location

\subsection*{2.0 BACKGROUND}

\subsection*{2.1 Characteristics of Noise}

Noise is defined as undesired and disruptive sound. It can be emitted from many sources, including airplanes, factories, railroads, power generation plants, and highway vehicles. Highway noise, or traffic noise, is usually a composite of noises from engine exhaust and tireroadway interaction.
The magnitude of noise is usually described by its sound pressure. Because the range of sound pressure varies greatly, a logarithmic scale is used to relate sound pressures to some common reference level, usually the decibel.

The A-weighted decibel scale is used almost exclusively in vehicular noise measurements because it reflects the frequency range to which the human ear is most sensitive (1,000-6,000 Hertz). Sound levels measured using an A-weighted decibel scale is generally expressed as adjusted decibels (dBA). For this report, all noise levels are expressed in dBAs. Several examples of noise pressure levels in dBA scale are listed in Figure 2-1, Comparative Noise Levels.

Figure 2-1 indicates that most individuals in urbanized areas are exposed to fairly high noise levels from many sources as they go about their daily activities. The degree of disturbance from undesired sound depends essentially on three factors:
- The amount and nature of the intruding noise;
- The relationship between background noise and the intruding noise; and
- The type of activity occurring where the noise is heard.

In considering the first of these factors (i.e., amount and nature of the intruding noise), it is important to note that individuals have different sensitivity to noise. Loud noises bother some individuals more than others, and some patterns of noise also enter into an individual's judgment of whether or not a noise is offensive. For example, noises occurring during sleeping hours are usually considered to be more of a nuisance than the same noises in the daytime.
With regard to the second factor (i.e., the relationship between background noise and the intruding noise), individuals tend to judge the annoyance of an unwanted noise in terms of its relationship to noise from other sources (background noise). For instance, the blowing of a car horn at night when background noise levels are typically about 45 dBA would generally be more objectionable than the blowing of a car horn in the afternoon when background noises are likely to be 60 dBA or higher.

Figure 2-1. Comparative Noise Levels (Source: Cowan, 1994)

The third factor (i.e., the type of activity occurring where the noise is heard) is related to the interference of noises with activities of individuals. In a \(60-\mathrm{dBA}\) environment, normal work activities requiring high levels of concentration may be interrupted by loud noises, while activities requiring manual effort may not be interrupted to the same degree.
Since sound is described in logarithmic scale (i.e., dBA), sound levels cannot be added by ordinary arithmetic means. In fact, a doubling of the noise source produces only a 3 dBA increase in the sound pressure (noise) level. Studies have shown that this increase is barely perceptible to the human ear, whereas a change of 5 dBA is readily perceptible. As a general rule, an increase or decrease of 10 dBA in noise level is perceived by an observer to be a doubling or halving of the sound, respectively.

Because the sound pressure level unit of dBA describes a noise level at just one moment and very few noises are constant, other ways of describing noise over more extended periods have been developed. One way of describing fluctuating sound is to describe the fluctuating noise heard over specific periods as if it had been a steady, unchanging sound. For this condition, a descriptor called the equivalent sound level ( \(\mathrm{L}_{\mathrm{eq}}\) ) can be computed. Leq is the constant sound level that, in a given situation and period (e.g., 1 hour, denoted by \(\mathrm{Leq}_{\text {(1) }}\), or 24 hours, denoted as \(\left.\mathrm{L}_{\mathrm{eq}(24)}\right)\), conveys the same sound energy as the actual time-varying sound.

\subsection*{2.2 Regulatory Framework}

\subsection*{2.2.1 FHWA Regulations and NHDOT Policy}

Traffic noise impact and abatement analyses were conducted in accordance with the procedures as set forth in the following regulations and policies: FHWA's Procedures for Abatement of Highway Traffic Noise and Construction Noise, 23 Code of Federal Regulations (CFR) Part 772; FHWA Highway Traffic Noise: Analysis and Abatement Guidance document issued December 2011; and NHDOT's Policy and Procedural Guidelines for the Assessment and Abatement of Highway Traffic Noise for Type I \& II Highway Projects, as approved by FHWA on November 30, 2016. The FHWA Noise Abatement Criteria (NAC) in 23 CFR Part 772 and the Noise Abatement Guidelines in the NHDOT policy were used to identify and evaluate noise impacts. The traffic noise level predictions and noise mitigation analyses were performed using FHWA's Highway Traffic Noise Model 2.5. The FHWA NAC are presented in Table 2-1.
A traffic noise impact is identified, and consideration of noise abatement is required, when:
- Leq (h) noise levels approach or exceed the FHWA NAC given in Table 2-1, where "approach" means within 1 dBA of the NAC.
- There is a substantial increase in the predicted noise levels over the existing noise levels, regardless of whether or not the NAC level is exceeded. NHDOT's policy defines a substantial increase as future build noise level 15 dBA Leq or higher than existing conditions.
Noise abatement measures must meet the criteria for feasibility and reasonableness, as presented in NHDOT's Policy.

The feasibility of noise abatement primarily relates to engineering and safety considerations for providing mitigation. A minimum of a 5-dBA noise reduction for at least one impacted receiver is required for a proposed noise barrier to be feasible, the design goal is to obtain a \(10-\mathrm{dBA}\) or greater insertion loss at the first row receptors. Safety considerations in designing noise barriers could include such factors as maintaining a clear recovery zone, redirection of errant vehicles, adequate sight distance, and fire/emergency vehicle access.
The factors considered when evaluating the reasonableness of a noise barrier are as follows:
- Effectiveness. The NHDOT's base effectiveness criterion is 1,500 square feet per benefited receptor (defined as all receptors receiving 5 dBA or greater insertion loss from the proposed barrier). For Type I projects, the effectiveness criterion is reduced depending on the percentage of benefited properties permitted for development after November 30, 2017. The effectiveness criterion is increased by 200 square feet (e.g., to a total of 1,700 square feet) for municipalities that have enacted noise compatible
planning requirements to mitigate noise impacts associated with new development near state highways.
- Noise Reduction Design Goal. The design goal is to provide 10-dBA insertion loss to the first row of benefited receptors. At a minimum, it must provide 7-dBA noise reduction for one benefited receptor.
- Views of the Benefited Receptors. Viewpoints of the affected community are considered through the NEPA public outreach process. If there are objections to a proposed barrier, a voting process is used to make the final reasonableness determination.

Source: Title 23 Code of Federal Regulations, Part 772.

\subsection*{2.2.2 Local Noise Regulations}

The Town of Londonderry adopted a local noise control ordinance on June 7, 2016, as an amendment to their municipal code, Title IV, Chapter XIV, Noise Regulations. Ordinance \#2016-03 is intended to control unnecessary and excessively loud noises between the hours of 10 p.m. and 7 a.m. in order to protect the public's health, safety, and comfort. During these specific hours, noises which are prolonged, unusual, and unnatural in their time and place are prohibited unless an exemption has been obtained. Ordinance \#2002-12, relative to municipal code, Title III, Land Use Codes, states that devices to muffle equipment noise, landscape earth berms, screen planting, decorative screen walls, or other barriers or devices shall be installed as necessary to achieve compliance with the Town of Londonderry noise control standards. Noise is expected to not exceed a maximum level of 75 decibels at property lines. Ordinance 97-6, An Amendment to the Zoning Ordinance related to Section VII-Commercial Performance Standards, also states that noise should not exceed 75 decibels at property lines and that all noise, except that generated by normal automobile, truck, or railroad service shall be muffled so as not to be objectionable due to intermittence, beat frequency, or shrillness.

The Town of Derry does not currently possess any local ordinances or regulations specifically pertaining to noise/construction noise.

\subsection*{3.0 EXISTING CONDITIONS NOISE MONITORING}

\subsection*{3.1 2007 DEIS Noise Monitoring}

Noise monitoring was conducted for the 2007 DEIS at 10 receptor locations in May and July 2006. The 10 monitoring sites are shown on Figure 3-1 as Sites 1 through 10. Table 3-1 presents noise levels from the 2007 DEIS monitoring effort.

Table 3-1. 2007 DEIS Monitoring Locations and Noise Levels
\begin{tabular}{|c|c|c|}
\hline Site Number & Address & Leq (dBA) \\
\hline 1 & 1 Tsienneto Road & 61 \\
\hline 2 & 75 Tsienneto Road & 69 \\
\hline 3 & 4 Seasons Lane & 63 \\
\hline 4 & 12 Trolley Car Lane & 64 \\
\hline 5 & 5 Coteville Road & 63 \\
\hline 6 & 1 London Road & 61 \\
\hline 7 & 29 Scenic Drive & 51 \\
\hline 8 & 112 Franklin Ext & 57 \\
\hline 9 & 120 East Broadway \({ }^{\text {a }}\) & 65 \\
\hline 10 & 70 West Broadway \({ }^{\text {a }}\) & 66 \\
\hline
\end{tabular}

In the 2007 DEIS, 120 East Broadway was incorrectly identified as 70 East Broadway, and 70 West Broadway was incorrectly identified as 120 West Broadway.

\subsection*{3.2 2016 Noise Monitoring Update}

Given the passage of time since the 2007 DEIS, updated noise monitoring was conducted in five locations along the Alternative A corridor in September 2016. The monitoring sites are:
- Site A: 25 Trolley Car Ln
- Site B: 52 Trolley Car Ln
- Site C: 60 Seasons Ln
- Site D: 4 Folsom Rd
- Site E: 71 Tsienneto Rd

Two of these sites, A and D, were chosen because they were monitored in the 2007 DEIS and determined to be impacted receptors. The other three sites, B, C, and E, were selected because they were shown as impacted receptors under Alternative A and were not monitored in the 2007 DEIS. Sites A, B, and C are located in an area where barriers are proposed as part of the I-93 widening, but would need to be modified as a result of the Exit 4A Project.

Figure 3-1 shows the monitoring locations, and monitoring results are summarized in Table 3-2. Short-term noise levels were measured during the AM peak hours (7:00-8:00 AM) and PM peak hours (5:00-6:00 PM) at each location. Traffic counts with vehicle classification were conducted simultaneously with the noise monitoring locations.

A Rion NL-42 Sound Level Meter (SLM) was utilized for field measurements. The SLM meets the requirements set forth in the ANSI S1.4-1983 Standards for Type 2 quality and accuracy. An acoustical calibrator (Norsonic 1251) was used to calibrate the SLM for each measurement interval. Calibration certificates for the equipment are provided in Appendix A.

The SLMs were operated on the A-weighting network and slow-meter response, as FHWA recommends. Measurements were not collected if roadway pavement was wet, or if wind speed exceeded 12 miles per hour. A porous windscreen was used on each SLM during all measurement periods, and measurements were taken by mounting the SLMs about 5 feet above the ground surface at each receptor. This height represents ear level of an average person. Wherever possible, measurement sites were located in open areas away from buildings or other potentially reflective surfaces, but which represented the outdoor use area of a given receptor.

During measurements, important events and site conditions were noted and a sketch was drawn for each receptor location. If an extraneous noise source interrupted the monitoring session, the measurement was then temporarily paused until the noise source was out of range. Noises of this nature, occurring at the time of measurement, included a swimming pool water pump and a lawn mower. No other unusual noises occurred during the morning or evening study hours. Appendix A provides photos of each monitoring location, field monitoring diagrams and traffic counts.

Table 3-2. 2016 Existing Conditions Noise Monitoring Results

\hline & & & 4:30 PM & 64.1 \\
\hline
\end{tabular}

Figure 3-1. 2007 and 2016 Noise Monitoring Locations

\subsection*{4.0 IMPACTS AND MITIGATION}

\subsection*{4.1 Traffic Noise Modeling Methodology}

Design year 2040 predicted noise levels were determined using Version 2.5 of the FHWA Traffic Noise Model (FHWA TNM). All FHWA TNM computer files are included electronically with this report (Appendix B).

\subsection*{4.1.1 Noise Sensitive Areas and Receptors}

The alternatives were divided into 11 noise sensitive areas (NSAs) for traffic noise modeling purposes as shown in Figure 4-1. Within each NSA, sensitive receptors were delineated within approximately 500 feet of the alternative corridors based on detailed land use and building data provided by Derry and Londonderry, with actual building use and location confirmed by aerial imagery.
For multifamily homes, apartments and townhomes, one receptor location was used to represent the multiple units in each building or building section. Multiple receivers were placed for nonresidential uses such as parks, cemeteries and schools based on the typical frontage length of nearby residential lots. The placement of residential and community facility receptors was based on a visual assessment of where outdoor use usually takes place on the side of the building closest to the roadway, for example the backyard of a house adjacent to I-93. If no outdoor use on that side of the building was reasonable (no back yard, for example), than the nearest possible outdoor activity area on the property to the roadway was used. Commercial business with outdoor uses received receptors based on the location of the outdoor use, for example, an outdoor seating area at a restaurant. Receiver height was set at the default height of 4.92 feet, to represent a person at ground level.

\subsection*{4.1.2 Roadways and Traffic Data}

The No Build Alternative and each Build alternative noise models include the widening of I-93 to four lanes in each direction. The I-93 final design plans were used to reflect the future edge of pavement of this roadway. The updated preliminary engineering plans for each Exit 4A project alternative were used for the proposed roadways. For major roadways (arterials, interstate and select major collectors), each individual traffic lane was modeled as a separate TNM roadway. For minor roadways, a single TNM roadway was used to represent both directions of traffic.
Traffic data for existing conditions (2015) and 2040 was obtained from the Exit 4A Traffic Technical Report. Separate methods to determine the appropriate percentage of traffic in each TNM vehicle class (auto, medium truck, heavy truck, motorcycle and bus) were used for the I-93 mainline vs other roadways. The I-93 vehicle class percentages were based on data from the permanent traffic recorder south of Exit 4, taken in May of 2015. The recorder provided a breakdown of traffic into 13 vehicle classes and included data on lane use of heavy vehicles, allowing the noise model traffic to reflect the actual lane usage by heavy trucks. For arterials and major collectors, the vehicle class percentages were based on a combination of field traffic counts taken during the 2016 noise monitoring along Folsom Rd and Tsienneto Rd, NH DOT vehicle counts, and Synchro data used to create the Exit 4A Traffic Technical Report. The noise monitoring traffic counts were used to determine the breakdown of vehicles into the six TNM
model categories for a typical road type, while the Synchro data was used to modify vehicles within those categories to reflect heavy vehicle percentages for each roadway segment.

\subsection*{4.1.3 Elevation Data Sources}

Within the footprint of the Exit 4A project, roadway vertical profiles and proposed contours were available from the SDEIS preliminary engineering effort. Outside the Exit 4A alternatives footprint, the I-93 widening final design plans were used to define elevations near the I-93 corridor. Existing ground elevation data beyond the immediate roadway construction area was obtained from high resolution LIDAR data, which was part of the LiDAR for the North East Project, 2011 Coastal LiDAR Acquisition by the USGS.

\subsection*{4.1.4 Terrain Lines}

Terrain lines were placed to define topographic features not already covered by another TNM feature that potentially block line of sight or influence ground cover noise attenuation.

\subsection*{4.1.5 Building Rows}

Rather than using the TNM building row function (which assumes a simplified percent building cover to estimate shielding rather than considering the actual geometry of specific buildings and gaps between buildings), buildings providing shielding to other receivers were modeled in greater detail as fixed height barriers. The location and dimensions of each building were based on detailed building GIS data provided by Derry and Londonderry. The height of each building was estimated using Google Street View and classified as either 15 or 25 feet.

\subsection*{4.1.6 Tree Zones and Ground Zones}

No tree zones were used given that thick year-round vegetation is required to appreciably reduce noise levels (areas of deciduous trees would not block line of sight in the winter). The default ground zone of lawn was used, no additional special ground zones were used.

\subsection*{4.1.7 I-93 Widening Noise Barriers}

Consistent with the inclusion of the I-93 widening in the 2040 No Build condition for the Exit 4A project, the I-93 widening noise barriers were digitized in TNM based on the I-93 final design plans. CAD files were used to determine the location of each barrier post and the height and finished grade elevation were taken from the soundwall post location tables.

Construction of the I-93 noise barriers was assumed as part of the modeling of noise impacts under the No Build Alternative. The barriers were also included in the Build Alternatives, with the exception of the areas where the barriers would conflict with the new interchange ramps. In these cases, the conflicting portion of the barrier was removed from the noise model, but the remaining portions were assumed to be left in place. Figure 4-2 illustrates the location of the I-93 widening barriers for NSA 4 and NSA 5, and the portions of the barriers assumed to be removed under the initial modeling of Alternatives A and B. The purpose of this initial modeling was to determine the total number of noise impacts in each NSA for comparing between alternatives. Determination of potential barrier modifications to account for the new interchange was conducted separately as part of the noise barrier evaluation.

Figure 4-1. Noise Sensitive Areas Overview

Figure 4-2. I-93 Widening Final Design Noise Barriers in NSA 4 and 5

\subsection*{4.1.8 Noise Model Validation}

Noise model validation refers to the FHWA requirement that traffic noise analyses demonstrate that the model is capable of predicting the field measured noise levels within 3 dBA . This is accomplished by modeling the same traffic volumes and vehicle mix counted simultaneously with the noise monitoring. Table 4-1 summarizes noise model validation results, showing that the modeled noise levels differ from the measured values by less than the required 3 dBA threshold.

Table 4-1. Traffic Noise Model Validation Summary
\begin{tabular}{|c|c|c|c|c|}
\hline Monitoring Location & Date/Time Period & Measured Leq, dBA & Modeled Leq, dBA & Difference \\
\hline \multirow{4}{*}{A} & Sept. 20- AM & 63.8 & 66.2 & 2.4 \\
\hline & Sept. 20- PM & 63.0 & 64.9 & 1.9 \\
\hline & Sept. 21- AM & 66.0 & 66.0 & 0.0 \\
\hline & Sept. 21- PM & 64.2 & 65.6 & 1.4 \\
\hline \multirow{4}{*}{B} & Sept. 20- AM & 70.5 & 68.8 & -1.7 \\
\hline & Sept. 20-PM & 69.1 & 67.5 & -1.6 \\
\hline & Sept. 21- AM & 70.9 & 68.5 & -2.4 \\
\hline & Sept. 21- PM & 70.3 & 68.2 & -2.1 \\
\hline \multirow{4}{*}{C} & Sept. 20- AM & 60.5 & 62.3 & 1.8 \\
\hline & Sept. 20- PM & 60.8 & 61.8 & 1.0 \\
\hline & Sept. 22- AM & 62.2 & 63.1 & 0.9 \\
\hline & Sept. 22-PM & 60.7 & 62.0 & 1.3 \\
\hline \multirow{3}{*}{D} & Sept. 20- AM & 74.2 & 71.8 & -2.4 \\
\hline & Sept. 20-PM & 74.4 & 73.8 & -0.6 \\
\hline & Sept. 21- PM \({ }^{\text {a }}\) & 75.2 & 73.3 & -1.9 \\
\hline \multirow{3}{*}{E} & Sept. 21- PM \({ }^{\text {a }}\) & 63.5 & 62.9 & -0.6 \\
\hline & Sept. 22-AM & 63.9 & 61.5 & -2.4 \\
\hline & Sept. 22-PM & 64.1 & 63.7 & -0.4 \\
\hline
\end{tabular}
a AM Time period not validated due to lack of traffic count data during the noise monitoring for that particular location/time period. Additional monitoring was not necessary since AM peak bi-directional traffic counts with classification were available from the second day of monitoring at each site

\subsection*{4.2 Impacts}

\subsection*{4.2.1 Noise Impact Summary}

Table 4-2 summarizes the initial noise modeling results for existing conditions, the No Build Alternative, and Build Alternatives A, B, C, D, and F in terms of impacted receptor points. The approximate boundaries of the NSAs shown in the table are mapped in Figure 4-1. Noise impacts were identified considering both the absolute predicted hourly Leq in comparison to the NAC. The incremental increase in noise relative to existing conditions was also evaluated to identify
receptors potentially experiencing a substantial increase (defined by NHDOT policy as an increase of 15 dBA or greater over existing conditions). AM and PM peak hour traffic was modeled separately for each Alternative, and the worst result for each receptor was used for purposes of the impact summary shown in Table 4-2.
It is important to note that the results in Table 4-2 include construction of noise barriers as part of the I-93 widening project under the No Build Alternative (and the Build alternatives, where the barrier is not in conflict with the particular alternative). As a result, the number of impacted receptors in each NSA is different from the detailed noise barrier evaluations presented in Section 4.3 where a true "no barrier" condition is evaluated for purposes of determining cost reasonableness of modified barrier configurations.
The single family residential and multi-family residential receptors correspond to FHWA Noise Abatement Criteria Activity Category B. The community facility and parkland receptors identified in the study area are all considered Activity Category C for purposes of the corridorwide comparison of alternatives (further detailed investigation of receptors impacted by Alternative A was conducted as part of the mitigation analysis). The Commercial with outdoor use land use type corresponds to Activity Category E. Category G (undeveloped lands that are not permitted) is addressed in Section 4.4.

Table 4-2. Traffic Noise Impacts Summary

\end{tabular}

Note: Results account for I-93 widening barriers, except sections of barriers in conflict with the alternatives (see Figure 4-2)

\section*{No Build}

In the majority of NSAs, noise impacts under the No Build Alternative would be similar to those predicted under existing conditions. In some cases, the number of No Build impacts would increase relative to existing conditions as a result of future growth in traffic volumes, such as along Tsienneto Road where the No Build Alternative would result in five additional impacted single-family homes and three additional multi-family/apartment receptor impacts (NSAs 7 and 8). The No Build Alternative noise levels at these Tsienneto Road receptors would be in the 6668 dBA range.
In the vicinity of the proposed Exit 4A under Alternative A and B interchange (Trolley Car Lane and Seasons Lane, NSA 4 and 5), the number of impacted receptors would decrease substantially relative to existing conditions because the No Build Alternative model includes the noise barriers proposed as part of the I-93 widening project. Overall, the total study area noise impacts under the No Build Alternative would decrease to 117, compared to 133 under existing conditions.

\section*{Alternative A}

Alternative A would conflict with portions of the I-93 widening noise walls in the new interchange area, resulting in 10 single family receptors impacted at NSA 4 and three impacted in NSA 5. The conflicting noise walls were assumed to be not constructed for the initial impact analysis. I-93 improvements proposed noise walls not in conflict with the new ramps were assumed to be in place. The majority of the impacted receptors at the interchange area would be in the 66 to 69 Leq, dBA range. Alternative A would also increase noise impacts on portions of Folsom Road (NSA 6) and Tsienneto Road (NSA 8) due to increased traffic volumes on these roadways. Overall, the number of impacted receptors would increase from 117 under the No Build Alternative to 138 under Alternative A (before considering mitigation).

\section*{Alternative B}

Similar to Alternative A, Alternative B would conflict with portions of noise walls planned for the I-93 widening project, increasing the number of impacted receptors at NSA 4 and 5 (Trolley Car Lane and Seasons Lane). Alternative B would cause traffic diversions that would reduce the number of noise impacts on portions of Tsienneto Road relative to the No Build Alternative (see for example NSA 8). Alternative B related traffic reductions on NH 102 in Derry would reduce the number of impacted receptors in NSA 11 (NH 28 to Bypass 28) relative to the No Build Alternative. However, Alternative B would impact residential areas along the new connector road alignment through Derry, including neighborhoods at Old Coach Road and Bypass 28 (NSA 2) and Barkland Drive and Scenic Drive (NSA 3). Overall, the total number of impacted receptors in the study area (101) would be less than the No Build Alternative. This result is consistent with Alternative B being located more on new alignment (in areas with fewer sensitive receptors) relative to the existing roadway corridor used by much of Alternative A (e.g., Folsom Rd. and Tsienneto Rd).

\section*{Alternative \(C\)}

Alternative C would result in nine impacted receptors in the vicinity of the new interchange location and along NH 28 (NSA 1). Impacts along the new alignment portion of the connector road through Derry would be similar to Alternative B (NSA 2 and 3). Also similar to Alternative

B, noise impacts would be reduced on portions of Tsienneto Road (NSA 8 and 11 most notably). Overall, the total number of impacted receptors in the study area would decrease relative to the No Build Alternative to 99.

\section*{Alternative \(D\)}

Alternative D would result in eight impacted receptors in the vicinity the new interchange location and along NH 28 (NSA 1). Impacts along Tsienneto Road from increased traffic volumes would similar to Alternative A (NSA 8 and 9). Overall, the total number of impacted receptors in the study area (115) would be similar to the No Build Alternative.

Alternative \(F\)
Noise impacts under Alternative F (120) would be similar to the No Build Alternative. Although traffic in downtown Derry would increase, it would not increase to an extent that would result in a substantial increase in newly impacted receptors. Noise levels would increase at receptors already considered affected in the No Build Alternative.

\subsection*{4.2.2 NSA Receptor Locations and Modeling Results}

The following section presents the figures and tables for each NSA receptor. The tables with the modeling results (Tables 4-3 through 4-12) are presented first followed by the figures for each NSA (Figures 4-3 through 4-17). Shading on the tables is used to indicate the receptors considered impacted under each alternative (whether due to approach or exceedance of the NAC or a substantial increase over existing conditions). Both the AM and PM peak hour traffic were modeled and the maximum hourly Leq for each receptor based on this data is reported in the tables.

Table 4-3. Noise Modeling Results for NSA 1 (Worst-Case Peak Hour, Leq, dBA)

Note: Shading indicates impacted receptors based on NAC or substantial increase over existing conditions. For purposes of determining impacts, results were
rounded to the nearest whole number (e.g., 65.6 dBA rounds to 66 and is considered an impact for a residential land use)
N/A: Not applicable, property is full acquisition
* Substantial increase over existing conditions

SFR: Single-family residence

Note: Shading indicates impacted receptors based on NAC or substantial increase over existing conditions. For purposes of determining impacts, results were
rounded to the nearest whole number (e.g., 65.6 dBA rounds to 66 and is considered an impact for a residential land use).
N/A: Not applicable, property is full acquisition
** Substantial increase over existing conditions
SFR: Single-family residence

Note: Shading indicates impacted receptors based on NAC or substantial increase over existing conditions. For purposes of determining impacts, results were rounded to the nearest whole number (e.g., 65.6 dBA rounds to 66 and is considered an impact for a residential land use)
N/A: Not applicable, property is full acquisition
** Substantial increase over existing conditions
SFR: Single-family residence

Note: Shading indicates impacted receptors based on NAC or substantial increase over existing conditions. For purposes of determining impacts, results were rounded to the nearest whole number (e.g., 65.6 dBA rounds to 66 and is considered an impact for a residential land use)
N/A: Not applicable, property is full acquisition
** Substantial increase over existing conditions
SFR: Single-family residence

\subsection*{4.3 Mitigation}

This section evaluates noise mitigation options for two locations where barriers were proposed as part of the I-93 widening project, as well as additional barriers along the proposed connector road where traffic noise impacts are predicted.

\subsection*{4.3.1 NSA 4 Trolley Car Lane}

\section*{Previous Analysis}

The 2004 I-93 widening FEIS presented the Trolley Car Lane neighborhood ("Location 23") as having 23 impacted receptors. A 12-foot barrier ( 6 -foot wall and 6 -foot berm) of 5,000 feet in length was proposed for an estimated cost of \(\$ 900,000\). The analysis estimated 28 receptors would be benefited, resulting in a cost of \(\$ 32,100\) per benefited receptor. Although the cost effectiveness criterion was slightly exceeded, the barrier was still recommended.
In 2008, the I-93 widening final design noise analysis recommended a 12-18 foot barrier (with 10 feet of the height on berm) 4,450 feet long. The barrier was estimated to benefit 28 receptors, cost \(\$ 1,068,000\), and have a cost per benefited receptor of \(\$ 38,000\). Although this exceeded the \(\$ 30,000\) threshold, the barrier continued to be recommended. The final barrier design did not anticipate the Exit 4A interchange ramps.
For purposes of comparing the benefit of new barrier options with the benefits provided by the I-93 widening barrier, the I-93 widening barriers were evaluated for the 2040 No Build condition. Table 4-14 summarizes the I-93 barrier performance results for each receptor based on the updated TNM models. This analysis excluded the I-93 widening barrier berms from the terrain data to evaluate the full benefit of the noise barriers.

\end{tabular}

\section*{Updated Analysis}

Trolley Car Lane was divided into two separate areas for purposes of the Exit 4A noise barrier evaluation (Trolley Car Lane and Trolley Car Lane south), separated by three single-family homes that would be total acquisitions under Alternative A (receptors Trolley Car 12, 13 and 14). As a result of these acquisitions and the placement of fill for the Exit 4A ramps shielding certain receivers in the center of the neighborhood from I-93 mainline traffic noise, a continuous noise barrier is no longer logical for this location.

\section*{Trolley Car Lane North}

Trolley Car Lane north consists of the remaining residences near the proposed southbound offramp. Based on the 2040 Build traffic projections, two receptors would experience traffic noise impacts with no barrier in place (Trolley Car 17 and Trolley Car 18).
Two barrier options were evaluated for Trolley Car Lane North as shown in Figures 4-18 and 4-19. The horizontal barrier alignment for the Trolley Car Lane north area was kept the same as the I-93 widening final design barrier alignment, from station \(3701+10\) at the northern end to station 3696. From station 3696 to 3685+50, the barrier alignment was modified to follow near the off-ramp edge of pavement, which allows the barrier to take advantage of being on fill required for the ramps.
The Trolley Car Lane North Barrier analysis (Table 4-15) shows there are insufficient receptors in the area for a barrier to be cost effective. The barrier design option closest to meeting the criterion (Option 2) would focus on protecting the two affected receptors only and would be about 10 feet high and 586 feet long. The square feet per receptor unit benefited would be 2,890, which exceeds NHDOT's criterion. A barrier option attempting to benefit more receptors would similarly not be cost reasonable.

\section*{Trolley Car Lane South}

Trolley Car Lane south consists of the residences near the proposed southbound on-ramp and south to Pillsbury Rd. Based on the 2040 Build traffic projections, nine receptors would experience traffic noise impacts with no barrier in place (Trolley Car 1, 2, 3, 4, 6, Hovey 1 , Hovey 2, and Hovey 3). Hovey 3 is a duplex that counts as two receptor units. It is important to note that the five northernmost receptors in this area are not considered impacted under Alternative A (Trolley Car 7, 8, 9, 10, 11). These receptors are below the elevation of the onramp, which serves to shield them from the full I-93 mainline traffic. This effect is illustrated by the "increase over existing" column in Table 4-16, which shows Alternative A would reduce noise at a majority of the receptors in this area by 3 to 5 dBA .

Figures 4-20 through 4-22 show the three Trolley Car Lane South barriers considered. The barrier was extended further south than the I-93 widening proposed barrier (to approx. station \(3656+50\) ), to study if this segment would provide any benefit to barrier performance. The horizontal barrier alignment for the Trolley Car Lane south area was kept the same as the I-93 widening final design barrier alignment from station \(3657+50\) to station 3661 . From station 3661 to \(3668+50\), the barrier alignment was shifted west by 5 feet or less to remain on the berm proposed in the I-93 final design plans. The northern end of the barrier near station 3671+75 would begin to follow the on ramp embankment. The barrier was not extended farther north because the receptors north of Trolley Car 6 are not impacted.
As shown in Table 4-16, the Trolley Car Lane South barrier analysis results demonstrate there are insufficient receptors in the area for a barrier to be cost effective. The option closest to meeting the criterion (Option 2) would focus on protecting the central portion of the NSA and would be have an average height of 11.6 feet and would be 1,080 feet in length. The square feet per receptor unit benefited would be 2,089 , which exceeds NHDOT's criterion.

\section*{Conclusion}

Table 4-17 provides an overall summary of the Trolley Car Lane barrier analyses in comparison to the I-93 widening barrier analyses, including cost information based on recent NHDOT bid prices (\$38 per square foot).
The selection of a preferred option by NHDOT and FHWA was based on consideration of which option would provide a benefit to impacted receptors comparable to the benefit that would be provided if the I-93 widening barriers were built without Exit 4A. NHDOT and FHWA are committed to providing noise barriers in these locations by the I-93 widening 2005 ROD and 2010 Supplemental ROD, regardless of whether the options meet the current noise policy effectiveness criterion. For both Trolley Car Lane North and South, the recommended barrier option for further evaluation during final design is Option 1.
Based on the studies so far completed, NHDOT is committed to the construction of feasible and reasonable noise abatement measures at Trolley Car Lane (North and South). These preliminary indications of likely abatement measures are based upon preliminary design for two discontinuous barriers with a combined length of approximately 2,700 feet and an average height of approximately 13.5 feet, that would reduce the noise level by at least \(5 \mathrm{~dB}(\mathrm{~A})\) for 13 residents. If it is subsequently found during final design that these conditions have substantially changed, the abatement measure(s) might not be provided. A final decision on the installation of the abatement measure(s) would be made during the final design process following the completion of public involvement.

\subsection*{4.3.2 NSA 5 Seasons Lane}

\section*{Previous Analysis}

The 2004 I-93 widening FEIS presented the Seasons Lane neighborhood ("Location 24") as having 10 impacted receptors. A 14-foot barrier (8-foot wall and 6-foot berm) of 2,500 feet in length was proposed for an estimated cost of \(\$ 550,000\). The analysis estimated 19 receptors would be benefited, resulting in a cost of \(\$ 29,000\) per benefited receptor. The cost criterion at that time (1996 policy) was \(\$ 30,000\) per benefited receptor, so based on this information a barrier was recommended.

In 2008, the I-93 widening final design noise analysis recommended a 14-18 foot barrier (with 10 feet of the height on berm) of 3,050 feet in length. The barrier was estimated to benefit 21 receptors, cost \(\$ 738,000\) and have a cost per benefited receptor of \(\$ 35,000\). Although this exceeded the \(\$ 30,000\) threshold, the barrier continued to be recommended.
For purposes of comparing the benefit of new barrier options with the benefits provided by the I-93 widening barrier, the I-93 widening barriers were evaluated for the No Build condition. Table 4-18 summarizes the I-93 barrier performance results for each receptor based on the updated TNM models. This analysis excluded the I-93 widening barrier berms from the terrain data to evaluate the full benefit of the noise barriers. The "barrier height" was calculated based on the top of barrier profile from the final design plans in comparison to pre-I-93 widening construction topography.

\section*{Updated Analysis}

The updated analysis for Exit 4A shows substantially fewer Seasons Lane receptors would be impacted than was predicted previously ( 12 receptors based on 2040 traffic and no barriers). The receptors are located on hill above the elevation of I-93.

Four barrier options were considered for Seasons Lane as shown in Figures 4-23 through 4-26. The horizontal barrier alignment for the Seasons Lane area was kept the same as the I-93 widening final design barrier alignment, from station \(1717+50\) at the northern end to station 1694. From station 1694 to \(1687+25\), the barrier alignment was shifted east to follow the right-of-way line in order to avoid conflict with the Alternative A northbound on-ramp and to take advantage of the terrain.

As shown in Table 4-19, Option 1 evaluated the barrier necessary to achieve 10 dB insertion loss at the majority of the first-row impacted receptors (the design goal per the November 2016 NHDOT Traffic Noise Policy). The option 1 barrier would be similar in total dimensions to the barrier recommended in the I-93 widening final design, totaling 2,983 feet in length and with an average height of 18 feet. In total, 16 receptor units would be benefited by the option 1 barrier, resulting in 3,367 square feet per receptor unit benefited, which exceeds the effectiveness criterion of 1,500 square feet per benefited receptor.

Barrier options that would provide less insertion loss or only protect a portion of the NSA were also considered, but similarly would not be able to meet the effectiveness criterion. Option 2 would be closest to meeting the criterion at 2,706 square feet per benefited receptor for a barrier with an average height 16.2 feet.

\section*{Conclusion}

Table 4-20 provides an overall summary of the Seasons Lane barrier analyses in comparison to the I-93 widening barrier analyses, including cost information based on recent NHDOT bid prices (\$38 per square foot).
The selection of a preferred option by NHDOT and FHWA was based on consideration of which option would provide a benefit to impacted receptors comparable to the benefit that would be provided if the I-93 widening barriers were built without Exit 4A. NHDOT and FHWA are committed to providing noise barriers in these locations by the I-93 widening 2005 ROD and 2010 Supplemental ROD, regardless of whether the options meet the current noise policy effectiveness criterion. The recommended barrier option for further evaluation during final design is Option 1.

Based on the studies so far completed, NHDOT is committed to the construction of feasible and reasonable noise abatement measures at Seasons Lane. These preliminary indications of likely abatement measures are based upon preliminary design for a barrier with a length of about 3,000 feet and an average height of approximately 18.1 feet, that will reduce the noise level by at least \(5 \mathrm{~dB}(\mathrm{~A})\) for 16 residents. If it is subsequently found during final design that these conditions have substantially changed, the abatement measure(s) might not be provided. A final decision on the installation of the abatement measure(s) will be made during the final design process following the completion of public involvement.

\subsection*{4.3.3 Folsom Rd./ Tsienneto Rd. Barrier Analyses}

Noise barriers were evaluated in 13 locations along Folsom/Tsienneto Road where noise impacts were predicted to occur under Alternative A. Each potential barrier was developed to include breaks as necessary to not directly conflict with driveways (see Figures 4-27 through 4-34). Multiple heights were modeled ( \(10,12,14\), and 16 feet) for each barrier and the best performing option identified as shown in Table 4-21. The barriers were compared to NHDOT's minimum acoustic criteria ( 7 dBA insertion loss for at least one benefited receptor, and 5 dBA insertion loss for at least one impacted receptor).
Barriers that met these acoustic criteria were then evaluated in comparison to the NHDOT effectiveness criterion of 1,500 square feet per benefited receptor. Three potential barriers met the effectiveness criterion:
- Barrier 3, located on the south side of the connector road between Ferland Drive and Franklin Street
- Barrier 5, located on the south side of Tsienneto Road east of Pinkerton Street
- Barrier 10, located on the north side of Tsienneto Road between Jeff Lane and Scenic Drive

The three barriers that were potentially reasonable and feasible based on acoustic performance and the effectiveness criterion were advanced for further evaluation of engineering, environmental, and safety issues. The engineering/environmental feasibility evaluations are as follows:
- Barrier 3: To provide adequate clear zones, the barrier would need to be located 6 feet offset from the sidewalk (or 4 feet behind a guardrail), which would result in an unacceptable slope limit encroachment into the entrance of the apartment building at 99 North High Street. In addition, this barrier could require extending the Shields Brook Bridge and additional costs of constructing the barrier on the structure.
- Barrier 5: There is insufficient space for construction of a sidewalk and barrier in several sections of this area without resulting in additional property acquisitions or construction of retaining walls that would make the barrier not feasible in terms of cost effectiveness. Existing retaining walls would also be impacted, as well as existing driveways. The eastern end of this proposed barrier would increase wetland impacts.
- Barrier 10: Construction of the noise barrier would necessitate the removal of mature trees in the front yard of two historic properties, which would likely constitute an adverse effect to the setting of these historic resources. There is also a sight distance issue at the intersection of Tsienneto Road and Scenic Drive that would necessitate locating the barrier almost to the front of the historic home at 72 Tsienneto Road to provide clear sight lines for the 35 mph design speed.
In conclusion, barriers 3, 5, and 10 would not be feasible from an engineering/environmental perspective and are not recommended for further consideration. The other 10 barriers evaluated for Tsienneto Road/Folsom Road are either not feasible based on acoustic considerations or not reasonable because they would not meet the NHDOT effectiveness criterion.

Table 4-21. Folosom Rd./ Tsienneto Rd. Barrier Analysis- Initial Evaluation of Acoustic Performance and Effectiveness Criterion

\subsection*{4.4 Undeveloped Lands Noise Analysis for Future Land Use Planning}

In addition to identifying impacts to existing land uses, FHWA's traffic noise regulations require consideration of "undeveloped lands for which development is planned, designed and programmed, which may be affected by noise from the highway." For this project, the primary undeveloped lands are the site of Woodmont Commons on the east and west side of I-93. Woodmont Commons is Planned Unit Development approved by the Town of Londonderry in 2013. Additional site plan review and local approvals are required for each portion of the plan to advance to construction-as of July 2018 no specific development proposal has been submitted for the portions of Woodmont Commons East and West closest to the interchange area (the areas of Woodmont East under construction are closer to Exit 4 and outside the study area). Although no building permit has been issued that would require detailed analysis of impacts and mitigation, noise contours were developed to aid the Town of Londonderry in future land use planning decisions in this area. The contours were developed by analyzing a dense receptor grid and TNM and interpolating contours using ArcGIS. The receptors were assigned elevations based on LIDAR data so that the noise contours accurately reflect existing terrain. Figure 4-27 shows the Alternative A 2040 PM peak hour noise contours for the immediate interchange area. The contours show the effects of terrain shielding provided by portions of the connector road ramps and that the size of the 66 dBA contour zone along the connector road is much smaller than the 66 dBA contour zone along the I-93 mainline, which is consistent with the I-93 volumes being substantially higher than the connector road.

Figure 4-35. Undeveloped Lands Noise Contours

\subsection*{4.5 Construction Noise Impacts and Mitigation}

Construction noise differs from traffic noise in length, type, and duration of noise events. Construction noise is of a fixed duration and ceases at the completion of the construction phase. Construction noise, usually limited to daylight hours, differs from normal vehicular traffic noise, which continues throughout the day- and night-time hours. Additionally, construction-related noise is responsible for a variety of impulsive, discontinuous noise sources, such as jack-hammer and/or vibratory rollers. Traffic noise, although varying in level, is more continuous as a noise source. Temporary increase in noise levels will occur during the time period that construction takes place. Noise levels due to construction, although temporary, can impact areas adjacent to the proposed project.
Impacts due to construction noise are dependent upon the following criteria:
- Time and duration of construction activities;
- Equipment types; and
- Equipment usage cycle.

Typical construction phases for the proposed project may involve the following construction activities:
- Demolition: Removal of structures within the right-of-way.
- Clearing and Grubbing: Existing landscaping, along with unwanted earth and rock.
- General Earthwork: Site topography will be altered in order to prepare the area for the roadway design. Earth moving operations will be required to prepare the roadbed. Trenches will be excavated for drainage materials.
- Foundations: Preparation for, and construction of, foundation support systems for both bridge and other primary foundation structures.
- Paving Operations: Preparation of the base layer, such as roadbed compaction and the laying of substrata material as well as surface paving operations.
- Finishing: Cleanup and landscaping.

Equipment such as bulldozers, scrapers, pavers, backhoe, graders, loaders, cranes, trucks, compressors, vibratory compactors, generators, and pile driving operations are typically utilized during construction.
Mitigation measures will be incorporated into the contract documents to lessen potential construction noise impacts. The following mitigation strategies will be employed to the extent practicable to limit the potential impact of noise:
- Source Control
- All exhaust systems in good working order, also using properly designed engine enclosures, and intake silencers.
- Regular equipment maintenance.
- Site Control
- Placement of stationary equipment as far away from sensitive receptors as possible (i.e., pumps, compressors, aggregate crushers, AC plants, operators, etc.).
- Choice of disposal sites and haul routes thereto.
- Employing shielding where possible.
- Time and Activity Constraints
- Schedule of operations to coincide with periods when people would least likely be affected.
- Limiting working hours and work days to least noise sensitive times.
- Community Awareness
- Public notification of construction operations.
- Methods to handle complaints.

\section*{Appendix F: NHDOT Environmental Justice Analysis}

\title{
STATE OF NEW HAMPSHIRE \\ DEPARTMENT OF TRANSPORTATION \\ INTER-OFFICE COMMUNICATION
}

DATE: June 4, 2018
IC.FROM: Jay Ankenbrock, Chief of Labor Compliance
TO: John Butler, Geometrics Engineer, Highway Design

RE: Environmental Justice Population Analysis, Project: Derry - Londonderry 13065

The attached analysis and recommendations are provided pursuant to Title VI of the Civil Rights Act of 1964 and Executive Orders 12898 \& 13166. The intent of these statutes is to ensure fair and full participation and the equal receipt of benefits under Federally-assisted programs. Your efforts to accommodate and encourage participation by traditionally underserved groups, where significant, will ensure program access and minimize the potential for disproportionate project impacts on protected groups.

The table entitled "EJ Population Analysis" shows the presence of protected groups that might be impacted by the project. Personnel responsible for project planning/design and the coordination of public meetings/hearings should use this analysis to guide their outreach efforts under Title VI and in support of developing a context sensitive solution. Based on the availability of information and where appropriate, we have included specific outreach recommendations to facilitate public comment from underrepresented groups.

Please note that US Census Bureau, American Community Survey (ACS) 2011-2015 data is used to provide to an EJ Population analysis for the project. If you have questions regarding this analysis, please contact me at 271-2467.

Encls: EJ Population Analysis, Derry - Londonderry 13065
cc: Keith Cota, Bureau of Highway Design
Michael O'Donnell, Bureau of Traffic
Kevin Nyhan, Administrator, Bureau of Environment
Paul Coddington, Bureau of Right-of-Way

\section*{EJ Population Analysis for Derry - Londonderry 13065}
\begin{tabular}{|c|c|c|c|c|}
\hline STUDY AREA & \begin{tabular}{l}
AVG\% \\
Elderly \\
Population
\end{tabular} & AVG \% Minority Population & AVG \% Low-income Household Population** & AVG\% LEP \\
\hline Impacted Area - Rockingham County, 1 mile radius of project area. & 13.5\%* & 3.9\% & 21.6\%* & 0.63\% \\
\hline Surrounding Area - Rockingham County, 3 mile radius of project area. & 10.9\%* & 4.43\% & 9.4\% & 0.63\% \\
\hline \multicolumn{5}{|l|}{\begin{tabular}{l}
REMARKS: \\
* The population percentage identified is meaningfully greater than the surrounding area and constitutes an EJ population. Characteristics of this particular study area indicate that targeted outreach efforts to solicit public participation should be taken. \\
** Low-income population for this analysis is defined as household income of less than \(\$ 25,000\). \\
LEP Definition: Where there is a population of people who speak English as a second language less than well (as indicated by the U.S. Census data). When a particular LEP language group constitutes \(5 \%\) of the impacted population, the Department is required to translate public information meeting notices and take appropriate measures to ensure language access. If this requirement exists, the Project Manager should contact the Title VI Coordinator for further assistance.
\end{tabular}} \\
\hline
\end{tabular}

Impacted Area: The impacted area was defined by the project limits and a 1 mile radius the immediate vicinity.

Surrounding Area: The surrounding area was defined by a 3 mile radius (excluding the impact area) of the project area

Special Considerations: Special consideration should be given to any project features that affect pedestrian accessibility. This project constitutes an alteration in accordance with Title II of the Americans with Disabilities Act. As such, minimum ADAAG accessibility requirements apply, unless deemed technically infeasible.

ADAAG was adopted as the 2010 Standards for Accessible Design on July 23, 2010 by the DOJ. Additional information is located at http://www.ada.gov/reg3a.html\#Anchor-Appendix-52467

For more information, I have also provided a link to the Draft Public Rights-of-Way Guidelines: http://www.access-board.gov/guidelines-and-standards/streets-sidewalks/public-rights-of-way/background/revised-draft-guidelines
The Draft PROWAG (Revised Draft Guidelines for Accessible Public Rights-of-Way) was released in November 2005 and has not been adopted by DOJ or FHWA. In 2006, FHWA issued a statement that the Draft PROWAG is to be considered best practice for making public rights-ofway accessible.
The Draft PROWAG includes specifications for detectable warnings and gives detailed information regarding their installation on curb ramps and on blended curbs, including at street corners, at cut-through islands and medians, and in front of buildings. It also has sections on accessible pedestrian signals (APS), roundabouts, channelized turn lanes, protruding objects, channelizing devices and barriers, and tactile and print signs.

Outreach Recommendations: In consideration of the populations above, we are providing contact information for all known agencies the project area. The Study area shows high rates for Low-Income and Elderly populations. These contacts should be included in your notification list for public information meetings and hearings related to this project

Appendix G: Known and Potential Petroleum and Hazardous Materials Sites

The following databases were researched as part of this report and were noted to have documented sites within the Project area. Potential petroleum and hazardous materials sites are listed in the table following the database descriptions.

ALLSITES: Provides information on sites in NH, with activities that either have resulted in groundwater contamination or pose a potential hazard to groundwater supplies. The regulated activities and groundwater hazards include: confirmed releases of oil or hazardous materials to the soil and/or groundwater as a result of discharges, spills, and removal of underground storage tanks; underground injection wells such as floor drains, leaching galleries, and septic systems anything other than domestic wastewater; large discharges of wastewater such as domestic wastewater septic systems which are designed to discharge more than 20,000 gallons per day (gpd), land application of wastewater treatment facility effluent (spray irrigation, rapid infiltration rapid infiltration basins, etc.) and unlined septage and wastewater lagoons; unpermitted hazardous waste storage facilities; landfills and other waste repositories in which groundwater quality is at risk.

AST Database: This database contains registered ASTs. The data came from the NHDES AST Registration Data List.

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System. This database contains information on potentially hazardous material sites that have been reported to EPA by states, municipalities, private companies, and persons, pursuant to Section 103 of CERCLA. CERCLIS contains sites, which are either on, or proposed to be on, the NPL, and sites that are in the screening and assessment phase for possible inclusion on the NPL.

CONSENT: Major legal settlements that establish responsibility and standards for cleanup at NPL (Superfund) sites. Released periodically by U.S. District Courts after settlement by parties to litigation.

ERNS: The Emergency Response Notification System. This system records and stores information on reported releases of oil and hazardous substances. The source of this database is EPA.

ECHO: Enforcement \& Compliance History Information database. EPA's ECHO provides integrated compliance and enforcement information for about 800,000 regulated facilities nationwide.

FINDS: Facility Index System/Facility Registry System. This database is maintained by EPA and contains both facility information and "pointers" to other sources of information that contain more detail. Databases under FINDS include PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), C-DOCKET (Criminal Docket System used to track criminal enforcement actions for all environmental statutes), FFIS (Federal Facilities Information System), STATE (State Environmental Laws and Statutes), and PADS (PCB Activity Data System).
FTTS: FIFRA/ TSCA Tracking System. FIFRA (Federal Insecticide, Fungicide, \& Rodenticide Act)/TSCA (Toxic Substances Control Act). FTTS tracks administrative cases and pesticide enforcement actions and compliance activities related to FIFRA, TSCA and EPCRA (Emergency Planning and Community Right-to-Know Act).

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing. A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all 10 EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA and TSCA. Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

LUST Database: This incident report contains an inventory of reported LUST incidents. The data came from the NHDES LUST Sites Summary Report.

MANIFEST is a document that lists and tracks hazardous waste from the generator through transporters to a Treatment, Storage and Disposal (TSD) facility. States maintain databases of manifested hazardous waste.

NH BROWNFIELDS: Sites that have benefited from one or more brownfields initiative.
NH DRYCLEANERS: A listing of drycleaner locations in NH.
NPL: Also known as Superfund, this database is a subset of the CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is EPA.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting RCRA of 1976 and the Hazardous and Solid Waste Amendments of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by RCRA. Conditionally exempt small quantity generators generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

RCRA NonGen / NLR: is also from the RCRAInfo database. Non-Generators do not presently generate hazardous waste.

RCRIS: The Resource Conservation and Recovery Information System: This database includes selected information on sites that generate, store, treat, or dispose of hazardous material as defined by RCRA. The source of this database is EPA.
ROD: Record of Decision: These documents mandate a permanent remedy at an NPL (Superfund) site, and contain technical and health information to aid the cleanup.

SEMS-ARCHIVE: Superfund Enterprise Management System Archive. This database tracks sites that have no further interest under the federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the NPL, unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is
no hazard associated with a given site; it only means that based upon available information, the location is not judged to be potential NPL site.

SHWS: State Hazardous Wastes Sites. These records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using State funds (i.e., state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data came from the NHDES Hazardous Material Inventory List.

SPILLS: This contains the state spills database and denotes an oil spill or release record from the NHDES Hazardous Waste Remediation Site database.

SWF/LF: Solid Waste Facility Information. Solid Waste Facilities/Landfill Sites. SWF/LF type records contain an inventory of solid waste disposal facilities or landfills in NH, maintained by NHDES.

SWRCY: Recycling Centers. A listing of recycling center locations in NH maintained by NHDES.

US BROWNFIELDS: EPA's listing of Brownfields properties from the Cleanups in My Community program, which provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US ENG CONTROLS: Engineering Controls Sites List. A listing of sites maintained by EPA with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

US INST CONTROL: Sites with Institutional Controls. A listing of sites maintained by EPA with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

US MINES: Mines Master Index File. Contains all mine identification numbers issued for mines active or opened since 1971. The data also include violation information. Maintained by the Department of Labor.

UST Database: This database contains registered USTs, which are regulated under Subtitle I of RCRA. The source of the data is the NHDES UST Registration Data List.

\subsection*{1.0 INTRODUCTION}

The Towns of Derry and Londonderry, New Hampshire (the Towns) and the New Hampshire Department of Transportation (NHDOT), in cooperation with the Federal Highway Administration (FHWA), are preparing a Supplemental Draft Environmental Impact Statement (SDEIS) for the Interstate 93 (I-93) Exit 4A Project (Project). The Project is located in the Towns and includes construction of a new interchange with I-93 (known as Exit 4A) and other transportation improvements to reduce congestion and improve safety along State Route 102 (NH 102), from I-93 easterly through downtown Derry, and to promote economic vitality in the Derry/Londonderry area.

The SDEIS presents the affected environment and the direct and indirect effects (environmental consequences) anticipated from the proposed Project in accordance with the requirements of the National Environmental Policy Act (NEPA; Public Law 91-190, 42 United States Code [USC] 4321-4347 as amended) and the regulations of the Council on Environmental Quality (CEQ; 40 Code of Federal Regulations [CFR] 1500-1508), as well as applicable FHWA regulations (23 CFR Part 771; 23 USC 138) and guidance (FHWA, 1987). Environmental consequences studied include impacts to water quality from each alternative assessed in the SDEIS. The Preferred Alternative in the SDEIS is Alternative A and that alternative is the focus of this report. Impacts from the proposed Project will include an increase in impervious area from additional roadway and a proportional increase in associated pollutants. Chloride, primarily from road salt used for winter road maintenance, is a pollutant of concern associated with increased impervious area.
This report provides:
- A review of the water quality regulatory environment for the proposed Project,
- An update on the status of chloride loading from NHDOT maintained roadways and municipally maintained roadways in the Towns of Derry and Londonderry in the Project area within Upper Beaver Brook watershed,
- A summary of expected chloride loading from the proposed Project and other reasonably foreseeable actions by others within the watershed, and
- A discussion of best management practices for the proposed Project and other reasonably foreseeable actions by others within the watershed that would be implemented to minimize chloride loading.

\subsection*{1.1 Existing Conditions}

The proposed Project lies within the Upper Beaver Brook watershed (Level 12 Hydrologic Unit 010700061025 ) as mapped in the US Geological Survey’s Watershed Boundary Dataset (NHDES, 2017a). Beaver Brook, south of the proposed Project, flows west under I-93 and then south into Massachusetts where it joins the Merrimack River in Lowell. Upper Beaver Brook has been subject to water quality investigations since 2003 in response to proposed development in the watershed, including widening and improvements to I-93 (NHDES, 2008).

\subsection*{1.2 Proposed Action}

The preferred alternative (Alternative A) for the proposed Project passes through Londonderry and Derry, with 3.2 miles of new alignment between the proposed I-93 Exit 4A interchange and eastern Derry. There would be approximately 1 mile of roadway construction on a new alignment, 1.6 miles of existing roadway reconstruction, and 0.6 mile of roadway with no improvements. It would originate from the proposed I-93 Exit 4A interchange location and travel southeast along new alignment through a wooded area to Folsom Road, near its intersection with North High Street and Madden Road. This alternative would continue to follow Folsom Road past Ross' Corner (Manchester Road/NH 28) and continue on Tsienneto Road across NH 28 Bypass to its end at NH 102, adjacent to Beaver Lake. Alternative A would cross Shields Brook, a perennial stream with a 3,767 acre watershed, as well as one other perennial stream on Tsienneto Road and several intermittent streams.

\subsection*{1.3 Indirect/Foreseeable Actions}

A Land Use Scenarios Technical Report (Louis Berger Group, 2017) prepared in conjunction with the SDEIS documents the development anticipated to occur if the proposed project were constructed. The Land Use Scenarios Technical Report predicts increased industrial development in Derry, increased residential development in Chester, and increased development in currently undeveloped land south and east of Exit 4A. Woodmont Commons, shown in Figure 1, is a planned, mixed-use, urban village in the Town of Londonderry. The developer, Pillsbury Realty Development, LLC, owns approximately 630 acres bordering the east and west sides of I-93. Alternative A would bisect the Woodmont East property.

Figure 1. Upper Beaver Brook Watershed - Project Alternative A and Woodmont Commons East and West

\subsection*{2.0 REGULATORY FRAMEWORK}

The Exit 4A project is subject to a variety of state and federal regulations and associated programs that ensure surface water quality is preserved or restored in all waters of the U.S. Impacts to waterbodies near the Alternative A alignment would necessitate involvement with these regulations as the Project proceeds through final design to construction.

\subsection*{2.1 Clean Water Act 303(d) and 305(b)}

The Clean Water Act (CWA), as amended in 1972, established the structure by which the federal government regulates discharges into the waters of the United States. Sections 303(d) and 305(b) of the CWA requires each state to submit two reports (CWA 303(d) report and CWA 305(b) report) to the U.S. Environmental Protection Agency (USEPA) every two years, documenting the water quality status of surface waters within the state. The New Hampshire Department of Environmental Services (NHDES) Watershed Management Bureau administers the monitoring and reporting of surface water quality to the USEPA. One of the required reports is New Hampshire's "305(b) Report" which describes the quality of New Hampshire's surface waters and analyzes the extent to which all such waters provide for the protection and propagation of a balanced population of shellfish, fish, and wildlife and allow recreational activities in and on the water.

The second report, required by Section 303(d) of the CWA requires submittal of a list of waters that:
- are impaired or threatened by a pollutant or pollutant(s);
- are not expected to meet water quality standards within a reasonable time even after application of best available technology standards for point sources or best management practices for nonpoint sources; and
- require development and implementation of a comprehensive water quality study (i.e., a Total Maximum Daily Load or TMDL study) that assesses pollutant loads consistent with water quality standards.

\subsection*{2.1.1 New Hampshire Surface Water Assessment}

The NHDES process for assessing surface water quality is detailed in the "Consolidated Assessment and Listing Methodology" (CALM) that interprets New Hampshire’s Surface Water Quality Regulations (Env-Wq 1702.17) and identifies "designated uses" for New Hampshire surface waters, defined as "the uses that a waterbody should support" (NHDES, 2017b).
Designated uses are listed in Table 1.

\section*{Table 1. Designated Uses for New Hampshire Non-Tidal Surface Waters \({ }^{\text {a }}\)}
\begin{tabular}{|l|l|}
\hline \multicolumn{1}{|c|}{ Designated Use } & \multicolumn{1}{c|}{ NHDES Definition } \\
\hline Aquatic Life & \begin{tabular}{l} 
Waters that provide suitable chemical and physical conditions for \\
supporting a balanced, integrated and adaptive community of \\
aquatic organisms.
\end{tabular} \\
\hline Fish Consumption & \begin{tabular}{l} 
Waters that support fish free from contamination at levels that pose a \\
human health risk to consumers.
\end{tabular} \\
\hline Shellfish Consumption & \begin{tabular}{l} 
Waters that support a population of shellfish free from toxicants and \\
pathogens that could pose a human health risk to consumers
\end{tabular} \\
\hline \begin{tabular}{l} 
Drinking Water Supply After \\
Adequate Treatment
\end{tabular} & \begin{tabular}{l} 
Waters that with adequate treatment will be suitable for human \\
intake and meet state/federal drinking water regulations.
\end{tabular} \\
\hline \begin{tabular}{l} 
Primary Contact Recreation (i.e. \\
swimming)
\end{tabular} & \begin{tabular}{l} 
Waters that support recreational uses that involve minor contact with \\
the water.
\end{tabular} \\
\hline Secondary Contact Recreation & \begin{tabular}{l} 
Waters that support recreational uses that involve minor contact with \\
the water.
\end{tabular} \\
\hline Wildlife & \begin{tabular}{l} 
Waters that provide suitable physical and chemical conditions in the \\
water and the riparian corridor to support wildlife as well as aquatic \\
life
\end{tabular} \\
\hline
\end{tabular}

Notes: a - NHDES (2017e)
b-Parameters for assessing wildlife are under development, so no assessments for this designated use have been made to date.

New Hampshire's Administrative Rules Env-Wq 1703 et seq. provide the thresholds for pollutants, dissolved oxygen (DO), color, temperature, and other criteria that must be met for surface waters to be in compliance. Designated uses are assessed in the CALM using a \(1-5\) scale, with 1 indicating that all designated uses are attained, and 4 or 5 indicating that the Assessment Unit (AU, the waterbody or stream segment used for recording assessments) is impaired for one or more designated uses, as defined in the CALM:
- AU Category 4A: Impaired or threatened for one or more designated uses but does not require the development of a TMDL because a TMDL has been completed.
- AU Category 4B: Impaired or threatened for one or more designated uses but does not require the development of a TMDL because other pollution control requirements are reasonably expected to result in attainment of the water quality standard in the near future.
- AU Category 4C: Impaired or threatened for one or more designated uses but does not require the development of a TMDL because the impairment is not caused by a pollutant.
- AU Category 5: Impaired or threatened for one or more designated uses by a pollutant(s), and requires a TMDL (this is the 303(d) List) (NHDES, 2017b).
For impaired waterbodies on the 303(d) list, a TMDL is calculated that establishes the maximum amount of a pollutant that can be allowed in a waterbody to achieve water quality standards for all designated uses (NHDES, 2008). A TMDL report also identifies the sources of the
pollutant(s) of concern and the quantity of pollutant that could be discharged by each source while achieving water quality standards. All TMDLs are subject to public review and comment and review and approval by EPA (NHDES, 2008). A TMDL is determined as:
\[
\mathrm{TMDL}=\mathrm{WLA}+\mathrm{LA}+\mathrm{MOS}
\]

Where "WLA" is the waste load allocation for point sources of a pollutant; "LA" is the load allocation for nonpoint sources of a pollutant; and "MOS" is the margin of safety to account for uncertainty and unknowns (NHDES, 2008).

\subsection*{2.2 Beaver Brook Chloride TMDL}

In 2008, the NHDES prepared TMDL studies for four waterbodies in southern New Hampshire that were adjacent to I-93 (NHDES, 2008). One of those was Beaver Brook, AU
NHRIV700061203-16 in Derry and Londonderry (Figure 1), which includes the surface waters within the Upper Beaver Brook Watershed \({ }^{1}\). According to the TMDL, the majority ( \(\sim 95 \%\) ) of chloride loading in the watershed is associated with de-icing activities for public and private roadways and parking lots. The TMDL was set as a load duration curve based on the chronic water quality standard ( \(230 \mathrm{mg} / \mathrm{L} \mathrm{Cl}\) ) reduced by \(10 \%\), to include a \(10 \%\) margin of safety, (=207 \(\mathrm{mg} / \mathrm{LCl}\) ) multiplied by each streamflow value in a four day average flow duration curve determined by NHDES (NHDES, 2008). The load duration curve expresses the TMDL in tons of chloride per day that can be imported to the watershed at a given flow and meet the chronic water quality standard (NHDES, 2008). Of the daily salt import total expressed by the TMDL, \(66 \%\) is reserved for the WLA (MS4 permittees) and \(34 \%\) is reserved for the LA (nonpoint sources) (NHDES, 2008). NHDES has also expressed the TMDL for Beaver Brook as an alternative form, the percent reduction goal, which establishes an annual salt load allocation in tons of salt per year (NHDES, 2008). The annual salt load allocation is not the TMDL (the TMDL is the load duration curve), but is used for implementing the TMDL by establishing a longer term goal (i.e. versus daily criteria) for watershed salt imports that can be expected to meet water quality standards. Based on empirical water quality data and annual salt imports from all salt sources in the watershed and including a \(10 \%\) margin of safety, NHDES set the annual Upper Beaver Brook watershed salt load allocation at 9,069 tons of salt per year (NHDES, 2008). The TMDL report also sets forth the process by which each sector would be allocated an annual quantity of salt to be applied (the "salt load"). The recommended salt loads were negotiated via a Salt Reduction Workgroup, with representatives from each sector of salt applicators. Recommended salt loads per sector were established in the "Chloride Reduction Implementation Plan for Beaver Brook - Derry, Londonderry, Auburn, Chester, NH" (NHDES, 2011a).

\subsection*{2.3 NHDES TMDL Implementation Plan}

A TMDL study establishes a target for reducing a pollutant(s) in order to achieve water quality standards in an impaired waterbody. A TMDL implementation plan may identify a framework for achieving load reductions through existing or necessary controls that address the identified source(s) of pollutant(s).

\footnotetext{
1 "Beaver Brook" as used in this document refers to the NHDES Assessment Unit NHRIV700061203-16, consistent with documents referenced in this report.
}

The Chloride Reduction Implementation Plan for Beaver Brook (NHDES, 2011a) specifies a number of best management practices (BMPs) to optimize salt use efficiency and identifies activities and target dates for achieving compliance with the TMDL (see Table 2). The BMPs were identified consistent with the implementation plan goals to reduce salt loads and attain chloride water quality standards in the Upper Beaver Brook watershed while preserving winter road maintenance standards and traffic safety.

\section*{Table 2. Chloride Reduction Implementation Plan Matrix (from NHDES, 2011a)}

\subsection*{2.3.1 NHDOT Implementation Plan}

A 19.8-mile section of Interstate I-93 from Salem, NH to Manchester, NH is undergoing reconstruction and widening to four lanes to improve transportation efficiency and safety with an expected completion date in October \(2019^{2}\). The I-93 project includes a 5.2 mile segment located within the Upper Beaver Brook watershed. In 2009, prior to NHDES' publication of the Chloride Reduction Implementation Plan for Beaver Brook (NHDES, 2011a) the NHDOT prepared the Implementation Plan to Increase the Efficiency and Effectiveness of Road Salt Use to Meet Total Maximum Daily Load for Chloride in Water Bodies along the I-93 Corridor from Salem to Manchester, NH: Beaver Brook; Dinsmore Brook; North Tributary to Canobie Lake; PorcupinePolicy Brook which demonstrated to NHDES how NHDOT could meet the Beaver Brook chloride TMDL (NHDOT, 2009).

\footnotetext{
\({ }^{2}\) http://www.rebuildingi93.com/content/news/ Accessed 4/18/2018.
}

The I-93 improvement project required a 401 Water Quality Certification (WQC) and preparation of an Environmental Impact Statement with a Record of Decision (ROD) from the FHWA that describes measures that would be taken to minimize harm to the environment, including water quality. To date, relevant BMPs identified in the Chloride Reduction Implementation Plan for Beaver Brook have been implemented including actions taken by NHDOT in executing the conditions of the I-93 project 401 WQC (NHDES, 2006) and consistent with the FHWA 2005 ROD for the I-93 project EIS (FHWA, 2005). NHDOT submitted a letter dated March 13, 2018 to Fuss \& O’Neill (Appendix A) that identifies all salt reduction BMPs that have been implemented to date consistent with the NHDOT Implementation Plan (NHDOT, 2009) and the NHDES Implementation Plan (NHDES, 2011a), as presented below (from Appendix A, pages 3-4). The NHDOT letter asserts, through implementation of salt reduction BMPs, compliance with all current permits (see Appendix A).
- Salt accounting - DOT meticulously monitors its salt stock in each patrol shed and reports that information annually to DES
- Pre-wetting - DOT applies liquid deicer to dry salt at time of application
- Anti-Icing - DOT applies brine directly to the pavement in advance of an oncoming storm when conditions allow
- Underbelly Plows - DOT utilizes these plows that enhance snow scraping / removal capabilities
- Ground-speed Spreader Controllers - All DOT trucks utilized out of Shed 528 have ground-speed, closed loop controllers
- Mobile Pavement Temperature Sensors - All DOT trucks located in Shed 528 have mobile pavement temperature sensors. Several road weather stations have also been established along I-93 corridor
- Equipment Calibration - DOT annually calibrates their spreader equipment prior to each season
- Enhanced Training - DOT provides enhanced training tracks participation via an online accounting system. Hired equipment operators are encouraged to attend
- Improved Storage Practices - DOT has just completed upgrading a depot shed in Salem which has increased indoor storage capacity
- Snow and Ice Forecasting - DOT utilizes computer software that provides forecast for plowing and salting with information feed from it Roadside Weather Information System
- Enhanced Plow Blade Technology - DOT utilizes flexible plow blades that provide better road contact and enhance snow scraping / removal capabilities
- GPS/AVL technology - All DOT spreader trucks located in Shed 528 are equipped with GPS/AVL which helps track salt usage by specific trucks and areas or interest.
- Variable Messaging Signs - VMS have been installed to warn drivers of impending or current weather and traffic conditions and set lower speed limits
- Enhanced Material Reporting Relative to Winter Severity - DOT has been reporting post-implementation salt usage relative to pre-implementation usage while adjusting for winter weather severity.

\subsection*{2.3.2 Town of Derry Implementation Plan}

The Town of Derry developed the document Salt Reduction Plan for: Beaver Brook with subsequent updates (Derry, 2011a; Derry, 2016) in response to the TMDL and the 2011 Chloride Reduction Implementation Plan for Beaver Brook (NHDES, 2011a). The 2016 Salt Reduction Plan, included as Appendix B, details several measures that have been implemented to reduce salt loading in Beaver Brook (Derry, 2016):
- Purchased five salt reducing plow trucks
- Salt pre-wetting sprayers on new trucks
- Groundspeed controls on new trucks
- Pavement temperature sensors on new trucks
- Salt spreader calibration program developed and implemented to ensure accurate application rates.
- All Derry municipal operators have been trained in the Green Snow Pro Program offered by the UNH Technology Transfer Center
- Derry regularly hosts the Green Snow Pro Program training in its municipal center on Manning Street.
- Derry officials supported the passage of the Voluntary Certified Salt Applicator law each time it was presented to the legislature.
- Derry has filmed and broadcasted plow truck ride-alongs on its public access television station.
- Derry has provided ride-alongs for the DES Salt Reduction Coordinator.
- Derry public television interviewed DES and UNH salt reduction experts during a segment about the chloride contamination issues in Beaver Brook.
The town committed in 2016 to equipping nine plow trucks with Automatic Vehicle Location (AVL) technology which will allow the town to track the amount of salt applied on each salt route and will log salt applied in a central database. This system also helps avoid duplicating salting efforts by displaying a trail of where other salt applicators have been.

\subsection*{2.3.3 Town of Londonderry Implementation Plan}

The Town of Londonderry developed a salt reduction plan (Londonderry, 2011) in response to the TMDL and the 2011 Chloride Reduction Implementation Plan for Beaver Brook (NHDES, 2011a). The Londonderry salt reduction plan, included as Appendix C identified a number of BMPs and implementation goals for reducing salt loads including equipment upgrades, improved equipment calibration procedures, private sector outreach, and improved weather monitoring. Londonderry reports in the document Town of Londonderry, NH Salt Reduction Best

Management Practices for the Beaver Brook Watershed Within the Boundaries of the Town of Londonderry (Londonderry, 2018a) that as of March 2018, they have completed the following:
- Purchased five dump trucks with underbody discharge spreaders
- Salt pre-wetting and ground speed control on new trucks
- Pavement temperature sensors on new trucks
- Spreader control units on new trucks to allow adaptive road treatment
- Developed and implemented spreader calibration policies
- Developed and implemented salt use tracking policies
- Salt reduction training program is required for town staff and road maintenance contractors
- Upgraded local weather forecast service to aid road maintenance decision making process

\subsection*{2.3.4 NHDES Private Sector Implementation Plan}

The 2011 Chloride Reduction Plan for Beaver Brook provides recommendations for salt reduction by the private sector including reporting of salt usage to the University of New Hampshire Technical Transfer Center. Specific elements of the implementation plan applicable to the private sector are itemized in Table 2. NHDES has also published "Best Management Practices and Salt-Use Minimization Efforts in Chloride-Impaired Watersheds of New Hampshire - A Guidance Document for Private Developers and Contractors" (NHDES, 2016 see Appendix D) which reiterates elements of the 2011 Chloride Reduction Plan and provides specific guidance on how to develop an individual Salt Minimization Plan. Individual salt minimization plans identify and describe the development being maintained, and provide the following:
- Operational Guidelines
- Winter Operator Certification Requirements - such as Green SnowPro \({ }^{3}\) Training, which is administered by NHDES
- Weather Monitoring - How weather information is gathered and communicated
- Equipment Calibration Requirements
- Mechanical Removal - information such as snow storage and plowing frequency
- Salt Usage Evaluation and Monitoring - Description of salt usage monitoring and reporting
- Analysis of Alternative De-icing Materials, Site Design Considerations and Watershed Offsets

}

\subsection*{2.4 Water Quality Permits Required for the Proposed Action \\ 2.4.1 National Pollutant Discharge Elimination System (NPDES)}

The National Pollutant Discharge Elimination System (NPDES) permit program, under the authority of the CWA, addresses water pollution by regulating point sources that discharge pollutants to waters of the United States. Two permitting programs under NPDES are relevant to highway construction projects in the Project study area: the Construction General Permit (CGP) and the Municipal Separate Storm Sewer System (MS4) general permit. While a Construction General Permit will be required for the Project, only the MS4 permit has a chloride nexus and is discussed in this section.

\section*{Municipal Separate Storm Sewer System (MS4) Permit}

The NPDES program requires that operators of Municipal Separate Storm Sewer Systems (MS4s) file a notice of intent to obtain coverage under the MS4 permit for stormwater discharge from these systems. MS4s are defined by the EPA as a stormwater conveyance or system of conveyances that is owned by a state, city, town, village, or public entity that discharges to waters of the U.S. Owners and operators of MS4s in 61 New Hampshire municipalities, including Derry and Londonderry, are required to apply for coverage under the MS4 permit program. In January 2017, EPA released the General Permits (GPs) for New Hampshire MS4s, which took effect on July 1, 2018 (USEPA, 2017). The MS4 general permit has special requirements for operators of MS4s that discharge to Beaver Brook, Dinsmore Brook, North Tributary to Canobie Lake, and Policy-Porcupine Brook. These requirements are detailed in Appendix F "Requirements of Approved Total Maximum Daily Loads" of the 2017 MS4 General Permits (USEPA, 2017).

\section*{NHDOT and Municipally Maintained Surfaces}

Under Appendix F Part I. 1 of the 2017 MS4 permit, municipalities (which includes NHDOT under this permit) must develop a Chloride Reduction Plan by July 1, 2019, which must be fully implemented by July 1, 2023. Elements of the municipal Chloride Reduction Plan, briefly, are:
- Tracking of salt applied (starting July 1, 2020)
- Planned activities for salt reduction such as:
- Operational changes (pre-wetting, pre-treating salt stockpile, increased plowing prior to de-icing, monitoring of road surface temperature) implemented by July 1, 2019
- New or modified equipment
- Staff training - implemented by July 1, 2019
- Adoption of guidelines for application rates
- Equipment calibration
- Designation of no-salt and low salt zones
- Estimate of total tonnage of salt reduction expected
- Implementation schedule - full implementation by July 1, 2023.

\section*{Privately Maintained Surfaces}

Private facilities that drain to an MS4 in the Upper Beaver Brook watershed also have chloride reduction requirements as specified in Appendix F Part I. 1 of the 2017 NH MS4 permit and must be included within a permittee's Chloride Reduction Plan. These requirements include:
- Private parking lots with 10 or more parking spaces draining to the MS4 must be identified
- Private parking lot owners and operators and private street owners and operators are required to utilize salt applicators trained and certified in accordance with Env-Wq 2203
- Private parking lot owners and operators and private street owners and operators have to report annual salt usage within the municipal boundaries to the UNH Technology Transfer Center or directly to the permittee
- Private new development and redevelopment projects are required to minimize salt usage, and track and report amounts used using the UNH Technology Transfer Center online tool (http://www.roadsalt.unh.edu/Salt/)

\subsection*{2.4.2 401 Water Quality Certificate}

Proponents of federal actions that propose discharges to waters of the U.S. that require a federal permit or license, such as a permit under Section 404 or Section 402 (e.g. MS4 GP) of the Clean Water Act, are required to obtain a Water Quality Certification (WQC) through Section 401 of the Clean Water Act. In New Hampshire, the NHDES Watershed Management Bureau administers this program. For projects that require a Section 404 permit from the Army Corps of Engineers and that fall under the NH Programmatic General Permit (USACE, 2017) the 401 WQC is programmatic under state WQC \#2017-404P-001, and no separate application is needed. Projects that require an individual Section 404 permit from the Army Corps of Engineers must apply for a WQC from the NHDES Watershed Management Bureau.

The NHDES Watershed Management Bureau commonly requires applicants for individual WQCs to develop and adopt a BMP-based Chloride Management Plan, as discussed in "Best Management Practices and Salt-Use Minimization Efforts in Chloride-Impaired Watersheds of New Hampshire - A Guidance Document for Private Developers and Contractors" (NHDES, 2016). The proposed Exit 4A project would be located entirely within the Upper Beaver Brook watershed and would require an individual WQC. Accordingly, the WQC will likely require a condition that NHDOT and the Towns prepare and adopt BMP-based Chloride Management Plans similar to the Chloride Reduction Plan (Appendix F of the 2017 MS4 permit) required for the MS4 permit.

\subsection*{2.4.3 Alteration of Terrain Permit}

The NHDES Alteration of Terrain (AoT) Bureau is also charged with oversight of the NH Water Quality Standards. The AoT Bureau issues permits for projects that disturb:
- 100,000 square feet or more,
- 50,000 square feet or more for projects within 250 feet of surface waters under the jurisdiction of RSA 483, the New Hampshire Water Quality Protection Act, or
- Projects of any size that disturb areas with a grade of 25 percent or greater within 50 feet of any surface water.

NHDOT has been granted an exemption from the requirement to obtain an individual Alteration of Terrain Permit by NHDES as detailed in an agreement signed by NHDOT and NHDES titled "Department of Transportation Terrain Alteration Permit Exemption" (NHDES, 2011b). The agreement recognizes that NHDOT projects are designed, constructed and maintained to comply with all provisions of state water quality standards under a number of state and federal regulations, standards, guidance documents, and contract provisions. These standards are listed in the agreement and are updated by NHDOT as needed:
- DOT Standard Specifications for Road and Bridge Construction, specifically Sections 107 and 645 (approved August 17, 2010)
- AASHTO "Highway Drainage Guidelines," 4th Edition, 2007
- EPA's "Developing Your Stormwater Pollution Prevention Plan-A Guide for Construction Sites," May 2007
- US Department of Transportation, "Best Management Practices for Erosion and Sediment Control," June 1995
- New Hampshire Department of Environmental Services "New Hampshire Stormwater Management Manual" Volumes 1, 2 \& 3, December 2008
- NHDOT "Guidelines for Temporary Erosion Control and Stormwater Management," 2002
- NHDOT "Best Management Practices for Routine Roadway Maintenance Activities in New Hampshire," August 2001
- NHDOT "Construction Manual"; June 1, 2006
- FHWA's "Guidance Manual for Monitoring Highway Runoff Water Quality" March 2001
- FHWA's "Urban Drainage Design Manual," September 2009
- FHWA's "Hydraulic Design of Highway Culverts," April 2012
- All applicable Federal Aviation Administration Advisory Circulars and Orders
- The American Railway Engineering and Maintenance-of-Way (AREMA) "Manual for American Railway Engineering and Maintenance-of Way Association," April 2015
The construction of the proposed Project will be in compliance with all requirements imposed under the 2011 agreement.

\subsection*{3.0 CURRENT CONDITIONS}

\subsection*{3.1 Impairment Status}

The 2008 chloride TMDL remains in effect for Beaver Brook (AU NHRIV700061203-16). Other reaches of Beaver Brook, NHRIV700061203-11 and NHRIV70061203-09, are listed in the most recent 303 (d) list (NHDES, 2017c) as impaired for aquatic life by chloride.

\subsection*{3.2 Regulated Discharges}

Discharges to Beaver Brook are currently regulated by the MS4 General Permit and by existing Alteration of Terrain permits for private development and municipal infrastructure, and under the 2011 agreement between NHDOT and the NHDES Alteration of Terrain program (NHDES, 2011b).

\subsection*{3.3 State and Municipal Chloride Loading in Upper Beaver Brook Watershed}

Annual salt use within Upper Beaver Brook watershed for NHDOT and the Towns (FY01 through FY10) was summarized in the NHDES Chloride Reduction Implementation Plan (NHDES, 2011a). Table 3 presents the annual chloride loading estimates for NHDOT Patrol Shed 528 and the municipally maintained assets for the Towns of Derry and Londonderry within the Upper Beaver Brook watershed for FY01-FY16 (NHDES, 2011a; Derry, 2018; Londonderry, 2018; NHDOT, 2018). NHDOT Patrol Sheds 508, 512, 513, and 514 are also responsible for state roadway maintenance in Upper Beaver Brook watershed but are not discussed in this report as only Patrol Shed 528 maintains state roadway within the Exit 4A project area. Other sources, including other NHDOT maintained assets, private roads and private parking lots, contribute significantly to chloride loads in the watershed, and therefore the ability of the watershed to meet the established TMDL, but are not within the scope of this report and are not presented (for a comprehensive presentation of chloride loads in Upper Beaver Brook watershed see NHDES, 2011a). Table 3 includes all reported tonnage for the Beaver Brook watershed from the Town of Derry which includes 14.4 acres of municipal parking lots, as Derry does not track municipal parking lot salt application separately, and no separate tally of salt application on municipal roadways has been published by NHDES since 2011 (NHDES, 2011a). Review of the table reveals the relatively high degree of variability in annual salt loading for Patrol Shed 528, Derry, and Londonderry. As may be expected, salt loading in Upper Beaver Brook watershed is strongly correlated with winter weather (NHDES, 2011a). A weather severity index (WSI) has been used by NHDES to evaluate seasonal salt application totals relative to overall winter severity (e.g. total snowfall, total storm hours, etc.) and a positive correlation was found ( \(\mathrm{r}^{2}=0.884\) ) over a ten year period from 2001 through 2010 (Section 4.2, NHDES, 2011a). As of 2011, NHDES reported chloride reductions were still needed in Upper Beaver Brook watershed to meet the TMDL target total annual salt imports, even with WSI adjustments to annual salt imports (NHDES, 2011a).
Table 4 presents estimates of salt loading rates for NHDOT Shed 528 and the towns of Londonderry and Derry's municipally maintained roads. Because Derry does not track municipally maintained roads separately from their 14.4 acres of municipally maintained parking lots, all of which fall within the Beaver Brook watershed, the average salt application outside of
the Beaver Brook watershed was used to calculate an estimate of the loading rate per lane mile, because it represents roadway salt use only.

Table 3. Salt Loading in the Upper Beaver Brook Watershed from NHDOT Patrol Shed 528 Maintained Roads and Municipal Sources for Derry and Londonderry: FY01 - FY16 (tons/year) (NHDOT, 2018; Derry, 2018; Londonderry, 2018)
\begin{tabular}{|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|c|}

\hline
\end{tabular}

Notes: a - Derry tracks salt usage within the Beaver Brook watershed but does not track municipal road salt application separately from municipal parking lot salt application. As such, municipal parking lots are included in this total.
b - Londonderry does not track salt loading within the Beaver Brook watershed separately from other municipal roadways. The Londonderry Salt Reduction Plan reports that there are 77.9 municipally maintained roadway lane-miles within the Beaver Brook watershed (Londonderry, 2011). Londonderry reports that there are 368.8 total municipally maintained lane-miles in Londonderry (Londonderry, 2018). Beaver Brook Watershed municipal road salt application was calculated by multiplying Londonderry's reported salt tonnage totals by 77.9/368.8.

\hline
\end{tabular}

Notes: a - Salt application tonnages for Derry municipal roads outside of the Beaver Brook watershed was used to estimate lane-mile application rates. Derry reports that total lane miles maintained by the town \(=329.8\). Total lane miles within the Beaver Brook watershed \(=212\).

\subsection*{3.4 Beaver Brook Chloride TMDL Monitoring}

A component of the 2008 Beaver Brook chloride TMDL is the requirement for in-stream monitoring to evaluate changes in water quality following approval of the TMDL (EPA, 2008). The TMDL specifies near-continuous ( 15 minute readings) specific conductance monitoring over a nine-year period from 2007-2016 at two water quality monitoring stations in the Upper Beaver Brook watershed to determine achievement of the TMDL. The two identified water quality stations are 10A-BVR (located on Beaver Brook at Fordway Ext. bridge) and 09-BVR (located on Beaver Brook at the outlet of Kendall Pond) as shown in Figure 1. Periodic chloride and specific conductance data exist for station 10A-BVR for the period 2002 through 2006. Nearly continuous monitoring data has since been collected at station 10A-BVR from July 2006 through June 2017 (NHDES, 2018) as presented in NHDES' annual TMDL Data Report and Quality Assurance Audit (NHDES, 2007, NHDES, 2008b, NHDES, 2009, NHDES, 2010, NHDES, 2011c, NHDES, 2012, NHDES, 2014, NHDES, 2015, NHDES, 2016b, NHDES, 2017d, NHDES, 2018). A nearly continuous data record also exists for station 09-BVR from July 2006 through June 2009 as presented in the NHDES' annual TMDL Data Report and Quality Assurance Audit (NHDES, 2007, NHDES, 2008b, NHDES, 2009).
A summary of water quality violations at the TMDL monitoring stations 10A-BVR and 09-BVR is presented in Table 5 as summarized from all available published data for the continuous specific conductance monitoring conducted in support of the Beaver Brook chloride TMDL study. The data presented were collected, quality controlled, and published by NHDES in their annual Data Report and Quality Assurance Audit. Numerous other water quality stations have been periodically monitored for chloride in the Upper Beaver Brook Watershed (see NHDES, 2007; NHDES, 2008a); however, the Beaver Brook chloride TMDL identifies attainment of chloride water quality standards at stations 10A-BVR and 09-BVR, determined by a period of continuous specific conductance monitoring, as one of the primary means for determining achievement of the TMDL (NHDES, 2008a) and is therefore presented here.
In the three years of continuous specific conductance and chloride monitoring at station 09-BVR, from July 2006 through June 2009, no acute or chronic chloride water quality violations were documented. Published data are not available beyond June 2009 at station 09-BVR. At station \(10 \mathrm{~A}-\mathrm{BVR}\), there are eleven years of continuous specific conductance monitoring data available and in that period there were no documented violations of the acute chloride water quality standard and there were two documented violations of the chronic chloride water quality standard as presented in Table 5. Both documented chronic chloride water quality standards violations were short in duration ( 5.28 days from November 29 - December 4, 2007; and 5.06 days from February 5 - February 10, 2011), as presented in Table 6. There have been no further documented chloride water quality standards violations at station 10A-BVR between February, 2011 and June, 2017 (i.e. the most recent published TMDL Data Report [NHDES, 2018]). Therefore, the TMDL monitoring data have demonstrated that the number and duration of chloride water quality standards violations have decreased since approval of the Beaver Brook chloride TMDL in 2008, with no violations documented in the past six years of published TMDL Data Reports.

\subsection*{4.0 DIRECT IMPACTS OF THE PROPOSED ACTION}

\subsection*{4.1 Methods}

The proposed Project falls entirely within the Upper Beaver Brook Watershed. Methods used to estimate chloride loading from each potential source are as follows:
Additional chloride loading for Exit 4A was estimated by identifying which of the proposed new lane-miles, as determined by CLD Consulting Engineers (CLD) \({ }^{4}\) would be maintained by NHDOT and the Towns. The on-off ramps and the bridge over I-93 (1.51 lane-miles or ln-mi) would be maintained by NHDOT-Patrol Shed 528. Londonderry would maintain the \(2.50 \mathrm{ln}-\mathrm{mi}\) that would be located within its town boundaries while 3.59 ln -mi would be the responsibility of the Town of Derry. Salt loading for each roadway section was assumed to equal the FY01 FY10 historic average annual salt loading rates for each entity shown in Table 3. Thus, salt loading for Exit 4A was calculated as: Average Salt Usage (tons/lane-mile/year) as calculated in Table 4 (by Entity) x Lane-Miles Maintained by Each Entity for Alternative A = Estimated Salt Loading (tons/year) for the proposed Project. The total estimated salt loading on public roadways is the sum of estimated salt loading by NHDOT plus the salt loading from the Town of Derry and Town of Londonderry.

\subsection*{4.2 Results and Table}

The total additional annual chloride loading estimated for the proposed Project is 99.4 tons per year.

}

Table Notes - a. This estimate assumes that salt application rates on all municipal lane miles within Londonderry are consistent.
b. This estimate assumes that salt application rates on all municipal lane miles within Derry are the consistent.

\subsection*{4.3 Chloride Mitigation}

Chloride mitigation in the Upper Beaver Brook watershed is addressed for current salt users in the 2017 NH MS4 permit (USEPA, 2017), which became effective on July 1, 2018 and is discussed in Section 2.4.1. A requirement of the 2017 MS4 Permit is for permittees to develop a Chloride Reduction Plan by July 2019, as detailed in Appendix F of the permit. One of the key components to developing a successful Chloride Reduction Plan will be identifying actions (BMPs) that will be used to reduce chlorides in the watershed and achieve the waste load allocation specified in the Beaver Brook chloride TMDL. The TMDL chloride reduction implementation plan (NHDES, 2011a), developed in support of the Beaver Brook chloride TMDL, outlines a number of BMPs that can be used to achieve significant reductions in salt use by the various salt users in the watershed as discussed in Section 2.3. Many of the same salt reduction activities identified in the TMDL implementation plan are also identified in Appendix F of the MS4 permit as recommended components of a permittees required Chloride Reduction Plan. The salt reduction BMPs identified in the TMDL chloride reduction implementation plan (NHDES, 2011a) are summarized in Table 9 including the associated \% chloride reduction potential for each BMP and the implementation status to date by the NHDOT and the Towns. As demonstrated in Table 9, many salt applicator BMPs which are planned or already implemented in the watershed have the potential to reduce salt use, during the specified operation, by as much as \(30-50 \%\). These actions also satisfy the salt reduction activities listed in Appendix F of the MS4 and therefore will likely be included as core components of the required Chloride Reduction Plans for NHDOT and the Towns and will likely be extended to any future actions requiring chloride mitigation, including the proposed Exit 4A Project.

The use of BMPs outlined in the TMDL chloride reduction implementation plan (NHDES, 2011) and summarized in Table 9, will likely result in significantly less salt load than could be achieved under the minimum requirements of the 2017 NH MS4 Permit, which does not require use of BMPs but rather recommends BMPs be included in a permittee's Chloride Reduction Plan (See Part I. 1 of 2017 NH MS4 Appendix F). Given the current level of adoption of salt reducing BMPs in the watershed by NHDOT and the Towns, it is likely that the watershed salt load, required to be reported in 2020 per the MS4 permit, will demonstrate compliance with the TMDL waste load allocation.

Notes: a. Reductions assumed do not take into account existing practices.
b. Highly dependent on existing procedures and level of adoption.

\section*{Chloride Mitigation for the Proposed Action}

The Beaver Brook chloride TMDL study (NHDES, 2008) developed a daily chloride load as a function of streamflow determined to attain water quality standards. The daily load/streamflow target is problematic for managing salt applicators, given the inherent variability of daily streamflow; therefore, the TMDL study also provides an alternative expression of the maximum daily load, presented as an annual salt load ( 9,069 tons/year), to allow for a more realistic salt management goal and aid with implementing the TMDL. The Salt Reduction Workgroup, an
interagency advisory group with representatives from NHDES, NHDOT, and other stakeholders (NHDES, 2008), is responsible for distributing the total allocation among various sectors of the Upper Beaver Brook watershed as presented in the most recent sector load allocations in the TMDL chloride reduction implementation plan (NHDES, 2011a). However, assigning sector allocations has proven to be difficult, due to the highly variable data inputs to the original TMDL, and sector allocations remain contentious. The total watershed salt allocation of 9,069 tons/year is the executable articulation of the TMDL percent reduction goal, regardless of current or future sector allocations, and is a basis for determining achievement of the TMDL.
Within the Upper Beaver Brook watershed, MS4 permittees are subject to the requirements of Appendix F of the 2017 NH MS4 permit including the requirement to "reduce chloride discharges to support achievement of the WLA included in the applicable approved TMDL." The Beaver Brook chloride TMDL study provides an alternative expression of the TMDL waste load allocation as an annual salt loading allowance (commonly called the "salt load allocation" of 9,069 tons salt/year (NHDES, 2008). The Beaver Brook chloride TMDL also does not "include an allowance for future growth, so any future construction of additional roads or parking lots in the Beaver Brook watershed would necessitate additional load reductions elsewhere in the watershed" (NHDES, 2008). Therefore, any future development in the Upper Beaver Brook watershed would be subject to the MS4 requirement for permittees to support achievement of the waste load allocation and it would be necessary to offset any exceedance of the salt load allocation that would result from future development through salt load reductions elsewhere in the watershed.

The Proposed Action will contribute an additional salt load to the watershed estimated to be 99.4 tons/year as presented in Section 4.2. This load represents \(1 \%\) of the 9,069 tons/year Upper Beaver Brook watershed salt load allocation, which is a minor increase. This additional salt load is expected to be offset by NHDOT and the Towns through development and execution of Chloride Reduction Plans as required in the 2017 NH MS4. In addition, NHDOT, Derry and Londonderry plan to implement salt reducing BMPs not specified in the MS4 permit (as presented in Section 2.3) which will provide additional assurances that the Project salt load will be offset and the Beaver Brook chloride TMDL can be achieved.

\subsection*{5.0 INDIRECT IMPACTS OF THE PROPOSED ACTION}

The proposed Project will improve access to areas currently inaccessible and will facilitate development of these areas. As such, development that will follow its completion is an indirect impact of the project. The proposed Project will likely result in additional industrial development in Derry if areas currently zoned as residential are rezoned as industrial, and if existing lower density industrial development are redeveloped. The project is also anticipated to facilitate more residential development in several towns, but particularly in Chester where 371 additional residential units are anticipated. Woodmont Commons, shown in Figure 1, is a planned, mixeduse, urban village in the Town of Londonderry. The developer, Pillsbury Realty Development, LLC, owns approximately 630 acres bordering the east and west sides of I-93. Alternative A would bisect the property. The Town of Londonderry recently granted approval of the Woodmont Commons West Phase I plan.

\subsection*{5.1 Methods}

This analysis assumes a range of build-outs of Woodmont Commons with separate accountings for Woodmont Commons East and Woodmont Commons West (including Market Basket expansion) to clearly account for the two related but separate actions. A separate estimate for additional Derry industrial development is also provided. New private road lane-miles and parking acreage were determined by Louis Berger Group (LBG) based on the documentation provided in the Land Use Scenarios Technical Document (Louis Berger Group, 2017).
Determinations for parking were made by assuming a 300 sq . ft. requirement for each expected parking space, including travel aisles associated with the parking spaces. For new private roadways, each divided roadway length was assumed to equal a single lane length while each non-divided roadway length was assumed to equal two lane lengths. Thus, the total mileage of divided streets was multiplied by one and non-divided street mileage was multiplied by two to yield total lane-miles. Existing roadways within Woodmont Commons were assumed to receive no additional salt loading, even if those roadways were to be upgraded, except when additional lane-miles were proposed.

Residential development has not been included in this calculation because the nature of residential development, including lot size and road layout, is not foreseeable. Chester is anticipated to have the largest proportion of increase in residential development, where approximately \(11 \%\) of the town (1,784 acres) falls into the Upper Beaver Brook Watershed.

\subsection*{5.2 Results and Table}

The foreseeable new parking and private roadways are summarized in Table 10. Development scenarios for the No-Build, Build (with Exit 4A) and incremental (development attributable to the project, or the difference between the Build and No-Build)

\section*{Table 10. Indirect Impacts New Parking and Roadways Summary}
\begin{tabular}{|c|c|c|c|c|c|c|c|c|c|}

Lane \\
Miles
\end{tabular} \\
\hline Woodmont Commons East & 4.70 & 4.43 & 6.18 & 26.38 & 6.14 & 7.53 & 21.69 & 1.71 & 1.35 \\
\hline Woodmont Commons West & 19.17 & 6.14 & 8.32 & 27.20 & 7.11 & 19.93 & 8.02 & 0.97 & 11.60 \\
\hline Additional Derry Industrial & 0 & 0 & 0 & 2.38 & 0 & 0 & 2.38 & 0 & 0 \\
\hline
\end{tabular}

The foreseeable new actions associated with the Woodmont Commons development will contribute to future chloride loading in the Beaver Brook watershed. Chloride loading for parking was determined using the application rate used in the "Data Report for the Total Maximum Daily Loads for Chloride For Waterbodies in the Vicinity of the I-93 Corridor From Massachusetts to Manchester, NH: Policy-Porcupine Brook Beaver Brook Dinsmore Brook North Tributary to Canobie Lake" (NHDES, 2007) of 6.4 tons/acre/year. This rate is in turn based on an analysis of salt use by maintainers of private roads and parking lots that was specifically prepared for the Beaver Brook TMDL titled "Salt Loading Due to Private Winter Maintenance Practices" (Sassan and Kahl, 2007). Sassan and Kahl established a range of 5.7 6.4 tons/acre/year, with 6.4 tons/acre/year being the average rate for educational institutions which had the best records of salt purchases and areas serviced. Sassan and Kahl acknowledge that there is a high degree of variability in salt application rate reporting from private applicators.
Chloride loading for new streets was determined from new lane-miles provided by LBG. Each divided roadway length was assumed to equal a single lane length while each non-divided roadway length was assumed to equal two lane lengths. Thus, the total mileage of divided streets was multiplied by one and non-divided street mileage was multiplied by two to yield total lanemiles. Existing roadways within Woodmont Commons were assumed to receive no additional salt loading, even if those roadways were to be upgraded, except when additional lane-miles were proposed. When additional lanes miles were added to existing roadways, the new lanemiles were added to the new lane-miles calculation. New chloride loading was determined using the average FY08-FY16 municipal rates, per methods described in Section 3.3.

Table 11. Salt Loading Attributable to Indirect Impacts (Tons / Year)

\hline Additional Derry Industrial & 0.0 & 0.0 & 0.0 & 15.3 & 0.0 & 0.0 & 15.3 & 0.0 & 0.0 \\
\hline Total & 152.8 & 112.1 & 153.7 & 358.2 & 140.6 & 291.0 & 205.4 & 28.5 & 137.3 \\
\hline Potential Additional Salt Load Range & \multicolumn{3}{|l|}{264.8-306.5 tons / year} & \multicolumn{3}{|l|}{498.7-649.2 tons / year} & \multicolumn{3}{|l|}{233.9-342.7 tons / year} \\
\hline
\end{tabular}

Under these scenarios, the salt loading from incremental development attributable to the construction of Exit 4A could range from 233.9 tons/year to 342.7 tons/year.

\subsection*{5.3 Chloride Mitigation}

The Beaver Brook chloride TMDL establishes an annual salt load allocation as an alternative expression of the maximum daily load requirement and is used as a planning and management target for various sectors in the watershed as discussed in Sections 2.2 and 4.3. Private parking lots are designated the largest sector salt allocation, approximately \(35 \%\) of the Beaver Brook watershed total salt load allocation in the most recent TMDL Implementation Plan (NHDES, 2011a). Development attributable to the construction of Exit 4A would potentially contribute 233.9-342.7 tons of salt/year, which would comprise \(2.5 \%-3.8 \%\) of the total watershed allocation of 9,069 tons of salt/year.

All future development (including additional development induced by construction of Exit 4A) will require implementation of reasonable and practical BMPs to reduce chloride loading, consistent with the Chloride Reduction Plans required in the MS4 permit and/or AoT permitting (as was required for Woodmont Commons Phase I, included herein as Appendix D). The 2017 MS4 permit has additional requirements for private sector salt applicators including requiring all existing and future private parking lot and private roadway owners to only utilize salt applicators who are trained and certified according to Env-Wq-2203 Certification of Commercial Applicators, report annual salt usage to the UNH T2 Center or to the MS4 permittee, and include the private sector in a MS4 permittee's Chloride Reduction Plan. These measures will assure reduction of salt loads in the private sector including indirect impacts as well as watershed-wide.

It is reasonable to expect the annual salt load from private roads and parking lots will decrease with adoption of the 2017 NH MS4 permit due to the salt reduction measures included in the permit. While the Beaver Brook chloride TMDL does not allow for additional future salt loads, development can occur as long as sector annual salt load allocations are met. Indirect impacts could potentially contribute a future additional salt load equivalent to \(2.5 \%-3.8 \%\) of the total watershed allocation and while this is not explicitly accounted for in the TMDL, it is possible for the private sector allocation, including Project indirect impacts, to still meet the allocation through adoption of BMPs. Studies have shown that salt application rates on private roads and parking lots can be reduced with BMPs (e.g. Hossein and Fu, 2015) well below the 6.4 tons/acre/year assumed for this study and as used by NHDES to develop their salt load estimates for private roads and parking lots (NHDES, 2007). Because salt application has historically not been required to be tracked in private parking lots, it is unknown whether the current salt load has been reduced to the allocation goal and if not whether the salt load increase attributable to indirect impacts will need to be further mitigated beyond the current permitting requirements. As private sector salt use data becomes available as part of the 2017 NH MS4 requirements, better assessments of the Beaver Brook salt imports compared to sector allocations will be possible and will serve to further guide management of chlorides in the private sector.

\subsection*{6.0 CONCLUSION}

NHDOT and the Towns have been implementing salt reduction BMPs in the Upper Beaver Brook Watershed since the 2008 Beaver Brook chloride TMDL was published. NHDOT reports
that they are in compliance with their Permits through execution of their respective Implementation Plans for chloride (Appendix A, page 1). Londonderry and Derry report that they are continuing with implementation of their salt reduction plans (Appendix B, Appendix C). Reasonably foreseeable actions are expected to contribute additional salt loads to the Upper Beaver Brook watershed as demonstrated in Sections 4 and 5 of this document. However, additional salt loads to the Upper Beaver Brook watershed are expected to be mitigated through the BMPs already in place and additional planned BMPs outlined in various implementation plans (NHDOT, 2009; Derry, 2011; Derry, 2016; Londonderry, 2011). The 2017 MS4 permit includes requirements for salt reduction implementation and reporting by the private sector, which contributes nearly half the total salt load to Beaver Brook (NHDES, 2011a), in Derry and Londonderry. When fully implemented, the 2017 MS4 will require all existing and future private parking lot and private roadway owners to only utilize salt applicators trained and certified according to Env-Wq-2203 Certification of Commercial Applicators and report annual salt usage to the UNH T2 Center or to the MS4 permittee.

It is anticipated that development and execution of a BMP based chloride reduction implementation plan (or plans) will be required as permit conditions to satisfy all applicable state and federal permitting requirements. BMPs required to be implemented will likely be comparable the BMPs currently implemented as part of the I-93 improvement project, with which the NHDOT reports they are in compliance, and comparable to the current BMPs implemented by the Towns. As such, the Towns and NHDOT would meet anticipated permitting requirements through extension of planned and currently utilized salt reduction BMPs.

\section*{Dear Chris;}

As the Exit 4A team works toward the draft Exit 4A NEPA document this spring of 2018, the Department's recommendation for our project's approach in addressing chlorides is to be consistent with TMDL Implementation plans for affected waterbodies in the Project Area (i.e.: Beaver Brook). In doing so, the qualitative analysis will need to take the following into account for the Exit 4A NEPA documentation:
1. Calculate a proposed increase in salt load for the activity, list the BMPs that can be used to mitigate the increase in salt usage, and provide project commitment to the continued employment of the BMPs in the TMDL Implementation Plans, as published, for the watershed;
2. Identify the BMPs to be included in the design and operation of the project, explain how these measures meet the requirements of the current TMDL Implementation Plans for the watershed (recommend using the narratives provided in the Implementation Plans for removal efficiencies);
3. Under Exit 4A existing conditions will need to include the operation of the I-93 fourth lane. The Department remains in compliance with the Beaver Brook TMDL Implementation Plan for chloride through the use of the following updated BMP-based approach;
a. Consistent with the adaptive management strategy in the l-93 ROD to the EIS, the Department has continuously and diligently worked with DES to identify and adopt various chloride reduction measures to reduce salt use in the project corridor from both DOT operations, and others. DOT has met the terms and conditions of the I-93 Water Quality Certificate (WQC) and, subsequently, the Implementation Plan developed by DES following completion of the TMDL studies;
b. Consistent with the I-93 WQC, Department has met all conditions, including specific chloride-related stipulations;
i. Condition E-6 (chloride monitoring) - performed the requested monitoring in six non-TMDL watersheds with data reports submitted to DES through FY 2012;
ii. Condition E-7 (TMDL studies) - assisted in the development of the TMDL studies by providing funding to cover DES costs, among other efforts;
iii. Condition E-8 (implementation plan development) - assisted in testing chloride reduction measures that were later included in the Implementation Plans (see table below);
iv. Condition E-9 (implement chloride reductions in the Implementation Plans) upgraded the Division of Operation's winter maintenance equipment for the I-93 corridor and other State-operated roads, and implemented all the various chloride reduction measures as outlined in DES' Chloride Reduction Implementation Plans (see table below).
v. Condition E-10 (DOT to implement adaptive management outlined in the I-93 ROD) - The Department contribution to additional chloride loads beyond those based on existing management practices is actually lower with anticipated reductions in the average annual road salt usage in excessive of \(20 \%\) on a per lane-mile basis. This is due directly to the implementation of the suite of BMPs described in the 1-93 ROD and outlined in Table I below.
4. With respect to the I-93 MOA, the DOT has met all the conditions specified. Consistent with the l-93 ROD and WQC, the MOA included a mechanism to fund the TMDL studies, DOT agreed to comply with the Implementation Plans, and to assist the municipalities and private sectors in complying with the Implementation Plans.

In summary, it is the Department's recommended approach for the Exit 4A NEPA document to take a qualitative approach versus quantifying the specific salt reductions (ie.: "counting grains of salt"). As you can see from the process noted above, our maintenance commitments and activities is best addressed through the expanded use of the BMPs identified in the DES Implementation Plan for the Beaver Brook watershed. By following these DES accepted practices, the chloride reduction goals will be achieved for the Exit 4A project.

Should you have any questions, please feel free to contact me. Thanks.

Keith A. Cota, P.E.

\subsection*{1.0 Introduction}

Beaver Brook has been identified as impaired by the New Hampshire Department of Environmental Services (DES) and the US Environmental Protection Agency (EPA) for chloride concentrations that exceed state and federal water quality standards. NH DES has completed a Total Maximum Daily Load (TMDL) analysis (April 2008) to quantify pollutant reductions needed to meet the state water quality standards for chlorides. The goal of the TMDL is to reduce chloride loads from all sources (municipal, state and private/commercial sources) so that water quality standards for all the designated uses affected by chloride pollution are met in all areas of the Beaver Brook watershed.

The TMDL is expressed as a load duration curve and is based on a 4-day average concentration. The units for the TMDL are expressed as tons of chloride per day. The TMDL was set at the level necessary to achieve the EPA and DES standard of \(230 \mathrm{mg} \mathrm{Cl} / \mathrm{L}\) standard which includes a \(10 \%\) margin of safety in order to address impacts associated with chlorides on the instream, benthic, and riparian communities. In order to meet water quality standards, significant reductions from current chloride loading from all sources are required. The Town of Derry has agreed to implement reduction measures and improve storage, handling and application operations in order to reduce the amount of chlorides applied during snow and ice removal operations while maintaining an acceptable level of service (LOS) on roadways. See Appendix A for a copy of the approved Municipal Resolution stating same.

This salt reduction plan will serve as a general scope of work for implementation of salt reduction efforts. The Federal Highway Administration has allocated funds to assist municipalities with salt source reductions to implement the chloride TMDL in the I-93 corridor. Preparation of this Salt Reduction Plan is a prerequisite to eligibility for these funds.

For purposes of this plan, salt or chloride reduction efforts not only include simply applying less de-icing materials that contain chloride, but a series of actions that include operational changes and improvements, mechanical upgrades, outreach and awareness activities, and monitoring, all of which are designed and implemented with the result being a net decrease in chloride loading to the watershed.

It is important to note that since the development of the TMDL and prior to development of this plan, the Town of Derry has already started taking chloride reduction measures including construction of a new salt/sand storage facility and loading procedures, calibration of spreaders, preparation of a draft outreach brochure targeted at the private/commercial sectors, and periodic conductivity monitoring of select tributaries to Beaver Brook that is separate from monitoring conducted by NHDES.

Beaver Brook is a 4.86 mile stream segment located in Auburn, Derry, Chester, and Londonderry, NH. The associated watershed is 30.33 square miles (NHDES, Total Maximum Daily Load (TMDL) Study for Waterbodies in the Vicinity of the I-93 Corridor from Massachusetts to Manchester, NH: Beaver Brook in Auburn, Chester, Derry, and Londonderry 2008) (see figure 3).

Derry is responsible for winter maintenance on \(212.78^{2}\) lane miles ( 106.39 road miles) of road within the watershed. Derry maintains \(29^{4}\) parking lots ( 14.4 Acres \(-627,483 \mathrm{Sq}\). Ft.) within the watershed. These parking lots include paved (impervious) lots associated with municipal operations (employee lots, highway and waste water facilities, fire and police stations, etc), general public use parking (town parks, municipal lots, library, cemetery, etc.) and the associated parking lot driveways

NHDOT is responsible for winter maintenance operations on approximately \(53^{2}\) lane miles within the entire Beaver Brook Watershed. Within the municipal boundaries of Derry ( within the watershed) NHDOT maintains approximately 4.4 lane miles of Interstate I-93 and approximately 17.6 miles of other state routes.

Roadways and parking lots which are not maintained by Derry or DOT are classified as private. These paved surfaces are maintained each winter season by a private snow and ice removal company hired by the respective land owner. Within the watershed and within the municipal boundaries of Derry there are approximately \(31.5^{2}\) lane miles ( 15.75 road miles) of private roads, \(270.5^{3}\) acres of parking lots, and \(9.18^{3}\) miles of parking lot driveways as of the date of this plan. The area of parking lots and parking lot driveways is expected to increase as additional development occurs in areas approved as commercial and industrial.

}

\subsection*{2.0 Plan Development}

The goal for the Salt Reduction Plan (SRP) is to set a policy and procedural framework to demonstrate how the Town of Derry will continuously work to improve winter maintenance operations while effectively and efficiently using road salt during snow and ice removal operations. New practices contained within this plan are intended to reduce the amount of road salt applied by the Town thus working towards meeting the Town's allocation of the required TMDL load reductions while continuing to meet town level of service (LOS).

Derry will provide winter maintenance to ensure the designated LOS to roadways, parking lots and sidewalks is maintained according to applicable state and local legislation while striving to minimize adverse impacts to the environment. These commitments will be met by:
- Adhering to the procedures contained within this Salt Reduction Plan;
- Committing to ongoing winter maintenance staff training and education;
- Reporting fiscal year salt use data to the NH DES
- Re-evaluating the effectiveness of the Salt Reduction Plan as needed to incorporate new cost-effective technologies or changes in procedures.

The SRP is meant to be dynamic to allow the municipality to evaluate and phase-in any changes, new approaches and technologies in winter maintenance activities in a fiscally sound manner.

To reduce the financial burden on municipal tax payers the town will participate in the I-93 Watersheds municipal salt reduction program developed in 2008 by the NH Department of Transportation in cooperation with the Federal Highway Administration. The program will administer a reimbursement process to assist towns with implementing TMDL load reductions. This SRP has been prepared in partial fulfillment of program requirements to address TMDL chloride load reductions.

\subsection*{3.0 Winter Maintenance Overview}

Derry is responsible for winter maintenance on various roads and parking lots within the watershed and winter maintenance involves numerous activities, not all of which involve snow clearing or deicing. The summary below provides detail on paved surface maintained, material usage, application rates, and level of service policy. The major activities related to winter maintenance are:

Table 1: Winter Maintenance Activities
\begin{tabular}{|l|l|}
\hline Snow Plowing & Snow Storage \\
\hline Salt/Sand Spreading & Sidewalk Plowing \& De-icing \\
\hline Salt \& Sand Storage & Install Hydrant Flags, Hydrant Clearing \\
\hline Snow \& Ice Removal & Drainage Clearing \\
\hline
\end{tabular}

The Town of Derry currently maintains \(160.81^{4}\) miles of public roads town-wide, and 14.4 acres of parking lots. Town-maintained parking lots include: town municipal offices, Derry Library, Derry Fire Dept., Derry Police Dept. Derry Transfer Station, Derry recreational parks, and a few public lots. All of the parking lots are located within the watershed, however approximately \(66 \%\) of roads are within the watershed.

Table 2: Town-Wide Road Mileage Summary
\begin{tabular}{|l|c|c|c|}
\hline Road Classification & \begin{tabular}{c} 
Average Daily \\
Traffic
\end{tabular} & \begin{tabular}{c} 
Typical Road \\
Width
\end{tabular} & \begin{tabular}{c} 
Number of Lane \\
Miles
\end{tabular} \\
\hline Arterial & \(3,000+\) & \(24^{\prime}-36^{\prime}\) & 56.6 \\
\hline Collector & \(1,000-3,000\) & \(22^{\prime}-24^{\prime}\) & 63.2 \\
\hline Access Street & \(<500\) & \(18^{\prime}-20^{\prime}\) & 210 \\
\hline
\end{tabular}

Note: Road classifications per NHOEP (http://www.nh.gov/oep/resourcelibrary/documents/12-roads.pdf)
Derry roads have been classified based on the average daily traffic and maintainer in order that LOS can be set for each classification of road. It should be noted that the LOS policy has remained consistent throughout the TMDL process. During snow and ice events, the LOS and operating procedures constantly change depending on numerous factors, all of which change depending on forecasts, projected road conditions, and the actual conditions observed. Some of the factors that affect the Town's LOS and OP include but are not limited to observed and anticipated precipitation rates, regular forecasts of snowfall and temperature changes throughout the storm, projected post-storm forecast (warm-up or deep freeze), time of day (solar assistance), and locality (hills or high traffic intersections). Derry also does not apply salt each time that plows are out and does not apply salt on unpaved roads. The Town's Snow and Ice Control Policy is included in Appendix B. Also included are select pages to the Town of Derry Winter Operations Booklet which is updated annually. Some pages are omitted as they include operators personal information (names and home phone numbers) which are subject to frequent changes.

Table 3: Summarized Level of Service Policy
\begin{tabular}{|l|l|}
\hline Arterial Roads & \begin{tabular}{l} 
Full width bare pavement as soon as practical after storm \\
event terminates.
\end{tabular} \\
\hline Collector Streets & \begin{tabular}{l} 
Full width bare pavement as soon as practical after storm \\
event terminates.
\end{tabular} \\
\hline Access Streets & \begin{tabular}{l} 
Full width bare pavement as soon as practical after storm \\
event terminates.
\end{tabular} \\
\hline
\end{tabular}

Materials used in winter maintenance vary annually and are a function of winter weather severity. The table below provides an overview of average material usage. A detailed 10 year average is provided within Appendix C. The 10 year average is used to evaluate salt usage to normalize the effects of more and less severe winters. NHDOT analysis has found that a 10 year average is approximately equal to the Weather Severity Index (WSI) normalized average.

Table 4: Annual Town Wide Material Usage Summary (Last 2 fiscal years)
\begin{tabular}{|l|c|c|r|}
\hline Material & \(\mathbf{2 0 1 4 / 2 0 1 5}\) & \(\mathbf{2 0 1 5} / \mathbf{2 0 1 6}\) & \(\mathbf{1 0}\) Year Average \\
\hline Solids & & & \\
\hline Rock Salt \((\mathrm{NaCl})\) & 5200 Tons & 4200 Tons & 3977 Tons \\
\hline
\end{tabular}

Table 5: Beaver Brook Watershed Usage
\begin{tabular}{|l|r|r|r|}
\hline Material & \(\mathbf{2 0 1 4 / 2 0 1 5}\) & \(\mathbf{2 0 1 5 / 2 0 1 6}\) & 10 Year Average \\
\hline Solids & & & \\
\hline Rock Salt \((\mathrm{NaCl})\) & 3772 Tons & 3432 Tons & 2625 Tons \\
\hline
\end{tabular}

Current application rates town wide are set at approximately \(300 \mathrm{lb} /\) lane mile ( \(\pm 50 \mathrm{lb}\) ). The material applied varies from a \(100 \%\) salt application to a \(20-25 \%\) Salt/Sand Mix. Town-wide plow route maps are included in Appendix D.

\subsection*{4.0 Proposed Best Management Practices (BMPs)}

\subsection*{4.1 Previous (Rounds 1-3) Best Management Practices Summary}

Derry has demonstrated an ongoing commitment to salt reduction in several key areas
Equipment: Derry has participated in each round of federal funding for salt reduction. It has purchased a total of five (5) salt reducing plow trucks with pre-wetting sprayers, groundspeed controls, pavement temperature sensors, and instituted a calibration program to ensure accurate application.

Training: All Derry municipal operators have been trained in the Green Snow Pro Program offered by the UNH Technology Transfer Center, and the municipality regularly hosts the training in its municipal center on Manning Street. Derry Officials also supported the passage of the Voluntary Certified Salt Applicator law each time it was presented to the legislature.

Public Outreach: The town has filmed and broadcasted plow truck ride-alongs on its public access television station. It has also provided ride-alongs for the DES Salt Reduction Coordinator. Additionally Derry public television also interviewed DES and UNH salt reduction experts during a segment about the chloride contamination issues in Beaver Brook.

Total Estimated Planned reductions from rounds 1-3 are summarized below:

Table 6: Summarized Estimated Reductions from rounds 1-3
\begin{tabular}{|c|c|c|c|c|c|}

TMDL \\
Allocation
\end{tabular} \\
\hline & Tons/Year & Percent & Tons/Year & Tons/Year & Tons/Year \\
\hline Beaver Brook & 2705.05 & \(18 \%\) & 486.91 & \(2,218.14\) & \(2,264.4\) \\
\hline
\end{tabular}

\subsection*{4.2 Equipment Upgrade Automatic Vehicle Location}

The town proposes to equip the nine (9) vehicles that operate within Beaver Brook with Automatic Vehicle Location (AVL) technology. This technology will allow the town to track the amount of salt applied on each of the salt routes dynamically. It will also log the amount of salt applied in a central database so that town staff can analyze application rates per route and storm for further optimization.

The system will also feature an in cab display where operators can view a 90 minute trail of the position of other plow vehicles. By viewing this trail operators will be able to stop spreading de-icing chemical in areas where they overlap with other plow trucks. Studies

\footnotetext{
\({ }^{5}\) per 10 year average from Round 1
}
have shown greater than thirty percent reduction (30\%) from overlap along in urban areas. Because Derry is somewhat rural the town is estimating a \(4 \%\) reduction due to implementation of this technology.

\hline
\end{tabular}

\subsection*{5.0 Implementation Cost \& Timeline}

Equipment costs reflect Derry's best estimate at this time. Costs may change due to factors beyond the town's control. The table below summarizes BMP and the associated estimated costs. It should be noted that matching funds will be compliant with 49 CFR18.24 and 49 CFR19.23.
\begin{tabular}{|r|r|c|}
\hline \multicolumn{1}{|c|}{ Table 8: Estimated Cost Table - Round 4 } \\
\hline BMP & Equipment & Estimated Cost \\
\hline 4.1 Equipment AVL Upgrade & \begin{tabular}{c} 
Nine AVL systems including \\
required data plan and support
\end{tabular} & \(\$ 47,500\) \\
\hline & Total Project Cost: & \(\mathbf{\$ 4 7 , 5 0 0 . 0 0}\) \\
\hline & Total Federal: & \(\mathbf{\$ 3 8 , 0 0 0 . 0 0}\) \\
\hline & Total Municipal Match (20\%): & \(\$ 9,500.00\) \\
\hline & Municipal Match Due: & \(\mathbf{\$ 9 , 5 0 0 . 0 0}\) \\
\hline
\end{tabular}

Table 9: Round 4 Project Timeline
\begin{tabular}{|c|c|}
\hline Time Period & Action \\
\hline March-April 2016 & Steering Committee Approval \\
\hline May 2016 & Budget Approval \\
\hline June 2016-October 2016 & Procurement \\
\hline November 2016 & Implementation \\
\hline
\end{tabular}

Notes: The town anticipates implementation for winter 2016-17. In the event that procurement is delayed the system will be implemented for winter 2017-2018.

\footnotetext{
\({ }^{6}\) Using Current 10 year average
}

\subsection*{6.0 Salt Usage Evaluation \& Monitoring}

Derry continues to monitor its salt usage with respect to TMDL compliance. Derry is committed to a multi-year program of efforts and operational modifications that would result in salt reduction with the goal of meeting TMDL load allocation requirements. It is anticipated that salt usage data will be compiled throughout the winter and be summarized and analyzed during the spring. Data will be provided to state agencies on an annual basis, and will be used in future salt reduction plans. Salt usage data will be substantiated with documentation such as invoices, cancelled checks, purchase orders, and or delivery receipts and be provided in total annual usage format based on fiscal/seasonal year on town letterhead.

DES proposes TMDL compliance will be measured using a 10 year average and confidence intervals as currently described in a DRAFT document titled "TMDL IMPLEMENTATION PLAN CONSIDERATIONS" dated April 15, 2010 prepared by NHDES and is included in Appendix E. This document is subject to change following additional Salt Reduction Workgroup discussions.

It is noted that determination of TMDL compliance hinges upon 1) monitoring conducted by DES at the compliance points and 2) DES providing Derry with compliance point monitoring data in a timely manner as it becomes available.

\subsection*{7.0 Summary}

The town commits to providing a written report and oral presentation to the salt reduction workgroup. The town is committing to reducing is chloride imports into the Beaver Brook Watershed by implementing the BMP's contained herein.

\title{
APPENDIX C: TOWN OF LONDONDERRY, NH SALT REDUCTION BEST MANAGEMENT PRACTICES FOR THE BEAVER BROOK WATERSHED WITHIN THE BOUNDARIES OF THE TOWN OF LONDONDERRY
}

\title{
Town of Londonderry, NH
}

\title{
Salt Reduction Best Management Practices
}

\author{
For \\ The Beaver Brook Watershed Within the Boundaries of the Town of Londonderry
}

The Town of Londonderry currently maintains a total of 186 miles of public roads and 26 acres of parking lots throughout the town. Londonderry is responsible for winter maintenance of 78 lane miles ( 39 road miles) of town owned roads within the Beaver Brook watershed. Londonderry also maintains 2 municipal parking lots (2.4 Acres) within the Beaver Brook watershed.

Londonderry provides winter maintenance to town roadways and parking lots in accordance with Londonderry's "Winter Maintenance Snow and Ice Control Policy" while striving to minimize adverse impacts to the environment. These efforts are met by:
- Adhering to the procedures contained within the Town's Salt Reduction Plan (SRP)
- Committing to ongoing winter maintenance staff training and education
- Reporting fiscal year salt use data to the NH DES
- Re-evaluating the effectiveness of the SRP as needed to incorporate new technologies or changes in procedures.

The goal of the Salt Reduction Plan (SRP) is to provide procedural framework for the Town of Londonderry to continuously strive to improve winter maintenance operations while effectively and efficiently using road salt during snow and ice removal operations. New practices, mechanical upgrades, outreach and awareness activities contained within the SRP plan are intended to reduce the amount of road salt applied therefore working towards decreasing chloride loading to the watershed and meeting the required TMDL.

The SRP is meant to be dynamic to allow the municipality to evaluate and phase-in any changes, new approaches and technologies in winter maintenance activities in a fiscally sound manner.

The town purchased five 6-wheel dump trucks with underbelly (dump/spreader combination) discharge spreaders also equipped with sprayers to prewet salt and a ground speed oriented spreaders. The trucks primarily are used in four plow routes of municipally maintained roads within the Beaver Brook watershed. In addition to the prewetting equipment the trucks are equipped with a pavement temperature sensor with in cab readout.

Spreader Control Units are used to calibrate and accurately dispense material regardless of vehicle speed. The controllers are capable of controlling pre-wetting equipment, ground speed oriented spreaders, and temperature sensor data. The units allow management to set application rates which will automatically change with vehicle speed and ground temperature. Prescribed application rates may only be changed with an administrative password.

Londonderry calibrates each spreader unit prior to the winter season using manufacturer information. Calibrated settings are logged in a master sheet, and stored inside the vehicle. Prior to each storm each truck is checked to verify that settings are calibrated to dispense the proper amount of chemical. Each unit is re-calibrated at least once during the season, and hydraulically controlled units are re-calibrated whenever the hydraulic system is altered or maintained.

Properly calibrated equipment ensures that each spreader is dispensing the appropriate amount of material for each storm. This practice reduces waste and improves efficiency of chemical dispensation

In-Cab Air/Pavement Temperature Sensor Unit provides air and pavement temperature readings on an in-cab display and integrate into the spreader control unit.

Electronically Controllable Hydraulic Valves allows the controller to adjust auger and spinner speeds.

In addition the town maintains a log of salt usage for snow plow routes to tabulate salt usage.
Londonderry takes advantage of NHDOT's knowledge based on the States application rates and best practices to aid in the success of the Salt Use Reduction.

Londonderry requires that all town staff and private contractors hired by the town attend salt reduction trainings. Londonderry is planning to engage in a public outreach program including sending mailers to local business owners encouraging them to require their winter maintenance contractors to attend salt reduction training. A website and local Access TV program will be created to educate homeowners and homeowner associations town-wide about proper salt use. The town will post informational brochures and best management practices information on town websites and in town hall. The town may also investigate other avenues such as posting winter driving tips in the town high school, and speaking to new drivers about safe winter driving. The town will also communicate with the local bus company. In addition the town will communicate with the private contractors who the town is aware of and encourage them to attend training. Londonderry strongly supports a program requiring the certification of private sector salt applicators.

The goal of the outreach program is to increase awareness and encourage private sector applicators to become trained and implement best practices. Outreach to new drivers and local bus companies is the first step in changing driver expectation within town and could result in less salt use in the long term.

Londonderry upgraded a contract with a meteorological service Precision Weather Forecasting to obtain custom storm forecasts for the community, with the capability of viewing and printing weather reports for use during winter storm events. This more accurate information results in more efficient salt use and applications at key points during the storm.

The town is committed to the efforts of reducing its chloride imports into the Beaver Brook Watershed by implementing the BMP's as described above.

}

Permit：AoT－1213

Dear Applicant：
Based upon the plans and application，approved on February 15，2017，we are hereby issuing RSA 485－A：17 Alteration of Terrain Permit AoT－1213．As part of the processing of this application，DES grants approval to waiving specific requirements of Rule Env－Wq 1507．04，Groundwater Recharge Requirements，finding that generally elevated groundwater elevations at the site preclude reasonable opportunities to recharge groundwater， and finding that some recharge will be achieved at proposed filtration basins．It was further determined that granting the waiver would not have an adverse impact on the environment，public health，public safety，or abutting properties，and that granting the request is consistent with the intent and purpose of the rule waived． Additional documentation relative to the waiver requested is contained within the file．This permit is subject to the following conditions

1．Activities shall not cause or contribute to any violations of the surface water quality standards established in Administrative Rule Env－Wq 1700.

2．You must submit revised plans for permit amendment prior to any changes in construction details or sequences．You must notify the Department in writing within ten days of a change in ownership．

3．You must notify the Department in writing prior to the start of construction and upon completion of construction．Forms are available at：http：／／des．nh．gov／organization／divisions／water／aov／categories／forms．htm． If any underground detention systems，infiltration systems，or filtering systems are installed，a letter must be provided，signed by a qualified engineer，stating that the individual observed such system（s） prior to such system（s）being backfilled，and that in his or her professional opinion，such system（s） conform to the approved plans and specifications．

4．The plans，latest revision dated February 13，2017，and supporting documentation in the permit file are a part of this approval．

5．This permit expires on February 15，2022．No earth moving activities shall occur on the project after this expiration date unless the permit has been extended by the Department．If requesting an extension，the request must be received by the department before the permit expires．The Amendment

6．This permit does not relieve the applicant from the obligation to obtain other local，state or federal permits that may be required（e．g．，from US EPA，US Army Corps of Engineers，etc．）．Projects disturbing over I acre may require a federal stormwater permit from EPA．Information regarding this

Alteration of Terrain Permit AoT-1213
Woodmont Commons, Planned Unit Development Garden Lane and Pillsbury Road
Tax Map 10, Block 41, 52, 54-1, Londonderry, NH
Page 2 of 2
permitting process can be obtained at:
http://des.nh.gov/organization/divisions/water/stormwater/construction.htm.
7. All stormwater practices shall be inspected and maintained in accordance with Env-Wq 1507.08 and the project Inspection and Maintenance (I\&M) Manual. All record keeping required by the I\&M Manual shall be maintained by the identified responsible party, and be made available to the department upon request.

8.Winter snow and ice management activities shall be in accordance with the Chloride Management Plan, Woodmont Commons - Planned Unit Development, Londonderry, New Hampshire, received by the Department on October 18, 2016.
9. If applicable, no activity shall occur in wetland areas until a Wetlands Permit is obtained from the Department. Issuance of this permit does not obligate the Department to approve a Wetlands Permit for this project.

\title{
WOODMONT COMMONS - PLANNED UNIT DEVELOPMENT LONDONDERRY, NEW HAMPSHIRE
}

\author{
Chloride Management Plan
}

\author{
WInter Operational Guidelines
}

The following Chloride Management Plan is for the Woodmont Commons Planned Unit Development in Londonderry, New Hampshire. The Plan Includes road salt source reduction methodologies in the categaries of, road salt equlpment specifications, certification requirements, stormwater management efforts, public awareness efforts, and road salt usage and monitoring requirements. Due to the evolving nature of chloride management efforts, the Chlorides Management Plan will be periodically reviewed to reflect the current management standards.

\subsection*{1.0 Background Information}

The Woodmont Commons live-work-play development is mostly located within the Beaver Brook Watershed In Londonderry and Derry, New Hampshire. In 2006, the New Hampshire Department of Envlronmental Services (NHDES) and the US Environmental Protection Agency (EPA) designated the Beaver Brook Watershed, and three additional watersheds along the l-93 corridor, as impaired watersheds due to locational chloride concentrations that exceed the Total Maximum Daily Load (TMDL) in portions of each watershed. Further studies within these watersheds identified the saurces of chloride loading as winter operational use of de-icing, anti-icing and pretreatment materials applied for the removal of snow and surface maintenance. These studies further attributed the primary sources of chloride loading to three major user groups. Within the \(1-93\) corridor, approximately \(10-15 \%\) of the overall chloride load was attributed to winter operational activities on State roads. Public and private sector user groups, the additional two groups identified, equally accounted for the remaining portion of the chloride load.

In an attempt to reduce chloride loading derived from the use of de-icing, anti-lcing and pretreatment materials applied for the removal of snow and surface maintenance within the Beaver Brook Watershed, the Towns of Londonderry, Auburn, Chester, and Derry, in conjunction with the New Hampshire Department of Transportation, have developed salt reduction plans for each of the four towns within the Beaver Brook Watershed. According to the Salt Reduction Plan for the Town of Londonderry, and the additional supporting documents used to develop the plan, source reduction is identified as the most effective method for reducing chloride loading in the Beaver Brook Watershed. The primary source reduction methodologies outlined in the Salt Reduction Plan focus on increased education opportunities for municipal employees and private contractors involved with winter operational activities, more accurately calibrated application methods, enhanced forecasting, improved surface monitoring technologles, and public outreach efforts that include measures to ensure that the private sector entities located within the Beaver Brook Watershed continually adhere to the current standards.

Included in the Salt Reduction Plan for the Town of Londonderry is the NHDES Watershed Management Bureau, 2010 Draft TMDL Implementation Plan Considerations document. In this document is a table for how the TMDL allocations are broken down in each of the four impaired watersheds. For the Beaver Brook Watershed, the ten year rolling average TMDL of 5,863.4 tons/year is distributed between NHDOT I-93, NHDOT other roads, Londonderry Municipal, Derry Municipal, Chester \& Auburn, Londonderry Private, Derry Prlvate, Londonderry Future, and Derry Future. The Plan further identifies that within the Beaver Brook Watershed the Town's objective is to reduce chloride imports by \(5 \%\) annually to achieve the ten year rolling average TMDL allocation.

In keeping with these expectations, the Town of Londonderry worked closely with the Woodmont Commons Management Team to ensure that the Master Plan reflected the objectives outlined in the Salt Reduction Plan for the Town of Londonderry.

\subsection*{2.0 Operational Guidelines - Chloride Management}

All Woodmont Commons Team Managers are responsible for assisting in meeting compliance for the following protocols. it is important to note that portions of the Woodmont Commons Property is NOT located in the portlon of the Beaver Brook Watershed that is impaired, runoff water leaving the property does pass through the impaired portion of the watershed. Woodmont Commons Team Managers are expected to minimize the effects of the use of de-icing, anti-lcing and pretreatment materials by adhering to the strict guidelines outlined below.

The Woodmont Commons winter operational de-icing, anti-icing and pretreatment materials will adhere to the following protocols:

\subsection*{2.1 Private Maintenance Contracting Equipment Requirements and Training}

Woodmont Commons serves as a model for private sector participation by committing to contract with snow removal maintenance providers who have been trained and are knowledgeable of the Best Management Practices (BMPs) for snow removal under reduced salt applications. Each Woodmont Commons Team Manager is responsible to know and be up to date on the current standards for snow removal under reduced salt applications. These practices are published and updated by the UNH Technology Transfer (T2) program.

All Woodmont Commons Team Managers directly involved with winter operational activities, and all private contractors engaged at the Woodmont Commons premises for the purposes of winter operational snow removal and surface maintenance, must be current UNHT2 Green SnowPro Certified operators or equivalent, and will use only pre-approved methods for spreading abrasives on private roadways and parking lats. When a salt aggregate or brining solution is applied for the purposes of snow removal or surface maintenance, it will adhere to the current BMP standard, including pre-treatment and ground speed-controlled spreaders as outlined in the NHDES August 2011 Salt Reduction Implementation Plan for the Beaver Brook Watershed.
2.1.1 MInimum Specification Requirements for De-icing, Anti-icing and Pretreatment Equipment All private contractors engaged at the Woodmont Commons premises for the purposes of winter operational snow removal and surface maintenance, must be current UNHT2 Green SnowPro Certified operators or equivalent. All equipment utilized on the Woodmont Commons premises for the purpose of winter operational snow removal and surface maintenance will conform to the following specifications.

\subsection*{2.1.1.1 Material Spreader Control Unit}

All equipment utilized for the applicatlon of road salt aggregate shall be equipped with a spreader control unit with the ability to calibrate and accurately dispense aggregate materials at a uniform density and frequency based on the forward rate of the vehicle or equivalent spreader carrier unit. At a minimum, acceptable spreader control units will include the capacity to control salt aggregates, pre-wetting equipment, ground speed orientation, and air/ground surface temperature data. The unit will also allow Woodmont Commons Operational Management password access to confirm and set calibration limits which will automatically adjust to the vehicle/carrier speed and ground surface temperature.

\subsection*{2.1.1.2 Brining Equipment Control Unit}

All equipment utilized for the application of brining and pre-wetting solution shall be equipped
with a spreader control unit with the ability to calibrate and accurately dispense brining and prewetting solution at a uniform density and frequency based on the forward rate of the vehicle or equivalent carrier unit. At a minimum, acceptable spreader control units will include the capacity to directly interface with salt aggregate equipment, pre-wetting equlpment, ground speed orientation, and air/ground surface temperature data. The unit will also allow Woodmont Commons Operational Management password access to confirm and set callibration limits which will automatically adjust to the vehicle/carrier speed and ground surface temperature.

\subsection*{2.1.1.3 Alr/Ground Surface Temperature Monitors}

All vehicie/carriers utilized for the application of road salt aggregate or brining and pre-wetting solution shall be equipped with an annually calibrated and operational air/ground surface temperature monitor capable of providing in-cab operator displays and automatic interface with a compatible spreader control unit. At a minimum, acceptable air/ground surface temperature monitor units will include the capacity to interface with spreader control units and be compatible with salt aggregate equipment, pre-wetting equipment, and air/ground speed orientation data. The unit will also allow Woodmont Commons Operational Management access to confirm and/or calibrate limits to ensure accurate interface with the vehicle/carrier speed and ground surface temperature function.

\subsection*{2.1.1.4 Electronically Controlled Hydraulic Valve Unit}

All equipment utilized for the application of road salt aggregate or brining and pre-wetting solution shall be equipped with an electronically controlled hydraulic valve unit capable of providing in-cab operator displays and automatic interface with a functional spreader control unit. At a minimum, an acceptable electronically controlled hydraulic valve unit will include the capacity to interface with a vehicle/carrier spreader control unit that automatically adjusts salt aggregates, pre-wetting equipment, ground speed orientation, and ground surface temperature data. The unit will also allow Woodmont Commons Operational Management access to confirm and/or calibrate limits to ensure accurate interface with the vehicle/carrier spreader control interface.

\subsection*{2.1.2 Equipment Calibration Requirements}

All equipment utilized on the Woodmont Commons premises for the purpase of winter operational snow removal and surface maintenance will conform to the following calibration requirements.

\subsection*{2.1.2.1 Annual Callbration Requtrements}

All private contractors engaged at the Woodmont Commons premises for the purpose of winter operational snow removal and surface maintenance shall provide two copies of the annual calibration report for each plece of equipment utilized on the Woodmont Commons premises. Each calibration report shall include the vehicle/carrier VIN number and the serial numbers for each component including, but not limited to, spreader control units, salt aggregate spreader equipment, brining/pre-wetting equipment, ground speed orientation unit, and alr/ground surface temperature monitor. Annual calibration reports will be available on file in the Woodmont Commons Property Management Building and be present in the vehicle/carrier at all times. Prior to each use, each vehicle/carrier operator will perform a systems check to verify that unit settings remain within the guidelines established by the Woodmont Commons Management Team in order to accurately dispense material. All private contractors engaged at the Woodmont Commons premises for the purpose of winter operational snow removal and surface maintenance will be subject to spot Inspections by members of the Woodmont Commons Management Team to ensure that each vehicle/carrier is operating in a manner consistent with the guidelines set herein or State and Municipal regulations. All units will be recalibrated and the updated calibration reports will be provided each time repairs or maintenance procedures affect the hydraulic system
of the vehicle/carrier.

\subsection*{2.1.3 Winter Operator Certification Requirements}

All private contractors engaged at the Woodmont Commons premises for the purpose of winter operational snow removal and surface maintenance must be current UNHT2 Green SnowPro Certified operators or equivalent, and will use only pre-approved methods for spreading abrasives on private roadways and parking lots. All private contractors engaged at the Woodmont Commons premises for the purpose of winter operational snow removal and surface maintenance shall provide to Woodmont Commons management two coples of the annual UNHT2 Green SnowPro certificate or equivalent for each operator utilized on the Woodmont Commons premises. The annual UNHT2 Green SnowPro certificate or equivalent for each operator will be available on file in the Woodmont Commons Property Management Building and be present in the vehicle/carrier at all times.

\subsection*{2.2 Improved Weather Monitoring}

Woodmont Commons will coordinate weather information for use by winter maintenance contractors. This information in conjunction with site specific air/ground surface temperature monitoring will ensure that private contractors engaged at the Woodmont Commons premises for the purpose of winter operational snow removal and surface maintenance will make more informed decisions as to when and to what extent de-icing, anti-icing and pretreatment materials are applied to private roadways, sidewalks, and parking lots.

\subsection*{2.3 Increased Mechanical Removal Capabllities}

Woodmont Commons will endeavor to use mechanical removal means on a more frequent basis for roadways, parking lots and sidewalks, Dedicating more manpower and equipment to increase snow removal frequencies prevents the buildup of snow and the corresponding need for de-icing, anti-icing and pretreatment materials. Shortened maintenance routes, with shorter service intervals, will be used to stay ahead of snowfall. Minimized snow and ice packing will reduce the need for abrasives, salt aggregates, and/or brining solution to restore surfaces back to bare surface states after winter precipitation events.

After storm events the Woodmont Commons management team will be responsible for having the streets swept to recapture unmelting de-icing materials, when practical.

\subsection*{2.4 Public Awareness Campaign}

Woodmont Commons will inform all future developers, grantees, and tenants at the Woodmont Commons development of the need to reduce the use of de-icing, anti-icing and pretreatment materials on roadways, parking lots, and sidewalks.

\subsection*{2.5 Summary}

The above-described methodologles are incorporated into the Woodmont Commons Operational Manual and are to be used to qualify and retain all private contractors engaged at the Woodmont Commons premises for the purpose of winter operational snow removal and surface maintenance. This section of the Manual, as with the Town of Londonderry's Salt Reduction Plan, is intended to be an adaptive management document that is modified as required based on experience gained from past practices and technological advancements that reflect chloride BMP standards. Each member of the Woodmont Common Management Team is required to review this document and the current standard Best Management Practices published by the UNH Technology Transfer (T2) program annually. Each member of the Woodmont Commons Management Team directly involved with winter operational guldelines is required to be certified as a UNHT2 Green SnowPro or equivalent and undergo the necessary requirements to maintain this certification annually.

\subsection*{3.0 Stormwater Management}

Wherever applicable, stormwater in locations subject to winter operational de-icing, anti-icing and pretreatment materials will be directed to the Woodmont Commons Tiered Stormwater Management System. The Woodmont Commons Stormwater Management System is designed using a comprehensive stormwater management philosophy designed to retain and treat stormwater based on land use. Stormwater volumes and pollutant signatures vary based on land use. By identifying the potential stormwater characteristics based on the land use, stormwater management efforts may be designed to remediate stormwater pollutants at the source level prior to conveying the stormwater down gradlent for additional treatment.

\subsection*{3.1 Woodmont Commons Tlered Stormwater Management System Overview}

The Tiered Stormwater Management Plan for the Woodmont Commons Planned Unit Development (PUD) is a multifaceted proposal composed of stormwater systems at the Slte Level and Area Level. These stormwater land-use goals can layer with additional land-use goals such as landscaping requirements, greenspace, greenway, actlve recreational, and passive open space components as defined in sections 2.4.6 PUD Site Plan Landscape Requirements and 2.3.6 Conserved Green Space and Shared Open Space Standards of the Woodmont Commons PUD Master Plan accepted by the Town of Londonderry on September 11, 2013.

Site Level stormwater management systems will focus on removal of total suspended solids (TSS), and if/where soil conditions are suitable, bio-remediation will be implemented to capture excess nutrient loads and other contaminants typically found in residential stormwater runoff.

Area Level systems will be spaced and sized to receive the stormwater from the Site Level systems, while extending the treatment processes and resonance period of the stormwater treatment.

The Area Level systems will detain and release the treated stormwater outside of the PUD area consistent with the rates of discharge prior to the project. The Area Level systems will provide additional filtration and macro nutrlent removal as the base rate of flow is slowed. The plants and microbial species selected will promote long-term nutrients entrainment and incorporate elements of vegetation to maintain optimum wildlife values, and bacterial and mycoremediation rates.

Much of the stormwater from the PUD on the west slde of I-93 will discharge to Duck Pond in the southwest corner of the Woodmont Common's property. The Duck Pond impoundment will be enhanced consistent with the Master Plan to promote recreational opportunities for the surrounding communities in a successional trajectory that is best suited to sustain the resource into the future.

\subsection*{4.0 Salt Usage Evaluation and Monitoring}

The Woodmont Commons Management Team is committed to an ongoing Chloride Management Plan to aid the Town of Londonderry in its efforts towards reducing chloride imports into the Beaver Brook Watershed. All prlvate contractors engaged at the Woodmont Commons premises for the purpose of winter operational snow removal and surface maintenance shall provide two copies of the standardized Storm Report, which includes detailed information regarding treatment areas and the use of de-icing, antiicing and pretreatment materials applied for the removal of snow and surface maintenance on the Woodmont Commons premises. Each spring, Woodmont Commons will submit a Summary Document, including coples of the Storm Reports, operator certifications, equipment used for roadway and sidewalk winter maintenance, calibration reports and amount of de-icing materials used, to the Town of Londonderry Department of Public Works for their use In documenting the chloride usage in the Beaver Brook Watershed.

\subsection*{5.0 Chloride Management Plan Summary}

The Woodmont Commons Management Team is committed to maintaining written documentatlon and adaptlve management solutions for the Town of Londonderry to supplement in its efforts towards reducing chloride imports into the Beaver Brook Watershed. These efforts include minimizing chloride imports Into unimpaired portions of the watershed by the implementation and enforcement of the BMP standards outlined above in section 2.0 Operational Guidelines - Chloride Management; implementation and maintenance of the efforts outlined above in section 3.0 Stormwater Management; and the adherence and adaptive management efforts outlined above in section 4.0 Salt Usage Evaluation and Monitoring.

\section*{Appendix I: 2014-2015 Vernal Pool Assessment Report}

\title{
2014-2015 Vernal Pool Assessment Report for NHDOT
}

March 2016
Hyrax-Pillsbury Property
East of I-93, Londonderry, NH

A vernal pool assessment was conducted from May 2014 through June 2015 on the 200-plus acre parcel of land owned by Hyrax Derry Partners LLC and Pillsbury Realty Development LLC (Hyrax-Pillsbury) located to the east of Interstate 93 in Londonderry, New Hampshire (the Property). This was a joint effort between Stable Growth Environmental LLC (SGE), Northeast Wetland Restoration (NWR) and Stoney Ridge Environmental LLC (SRE), with field work completed by Michael Parsont (NH Certified Wetland Scientist), Gerard Thomas (Wildlife Biologist), Richard Bolton (Wildlife Biologist) and Geoffrey Wilson (Urban Forester).

This assessment was performed five years after a prior study was conducted by Normandeau Associates (Normandeau) in April-May 2009. Locations of the pools identified on or immediately adjacent to the Property by Normandeau were documented in their Hyrax Wetland Delineation Report, dated September 2011, which utilized the data collected by Normandeau staff from the 2009 vernal pool survey. In June-July 2013, SGE/NWR initially visited the 2009 pool sites, as reported in 2011. These sites were further assessed in the field by SGE/SRE during the vernal pool amphibian breeding season in May 2014; by SGE towards the end of the two-month required hydroperiod in early June 2014 and to assess pool permanency in September 2014; by SGE/SRE during the vernal pool amphibian breeding season in May 2015; and by SGE in early-mid June 2015.

By definition, vernal pools are required to hold water for at least two continuous months in the spring and/or summer, and are intended to be seasonal not permanent (see enclosed State and Federal vernal pool definitions). Therefore, to designate a pool site as a "vernal pool", a minimum of two field observations in the same year are necessary to document the wet/dry cycle, one of which must be during the vernal pool amphibian breeding season to identify the presence of indicator species and the other should occur later within two months following spring ice-out.

Enclosed with this report is a figure prepared by CLD Consulting Engineers, Inc. (CLD) that shows the locations of the 2009 vernal pools (identified by Normandeau in the September 2011 report as on or immediately adjacent to the Property) that are within the limits CLD defined for this report. A table is enclosed that identifies these 2009 vernal pools. Subsequent columns in this table include: (1) relevant information taken from Normandeau's 2011 chart; (2) indicators present as identified on Normandeau's 2009 data forms; (3) indicators present in May 2014; (4) if water was present in June 2014; (5) if water was present in September 2014; (6) indicators present in May 2015; (7) if water was present in June 2015; and (8) comments. The comments include: 2006 indicators data from a Woodlot Alternatives Inc. study (for ten of the 2009 vernal pools), distinctions between the Normandeau 2011 report and the 2009 data forms, additional 2014-2015 considerations and pool quality determination. The Woodlot Alternatives information was obtained from the 2006 Draft Environmental Impact Statement, which states the study was comprised of one visit to each pool in late April 2006 with no follow-up visits.

Stable Growth Environmental LLC

Precipitation records for Concord, New Hampshire, from 1868 to present, show that 2005 (57 inches) and 2006 ( 55 inches) were the second and third highest precipitation years on record to date, respectively. Additionally, 2008 ( 58 inches) was the highest precipitation year to date, while 2009 had 47 inches total, which was well above the average of 41 inches. Meanwhile, 2012 and 2013 were average ( 40 and 41 inches respectively), 2014 was above average ( 46 inches) and 2015 had been well below average at the time of the final pool assessments ( 10 inches to May 31, 2015, with the average being 16 inches through that date).

There are a total of eleven pool locations identified on the enclosed table. An SGE NH Vernal Pool Determination/Assessment Data Form is enclosed for each of these locations. Based on the information obtained during the 2014-2015 field assessments, two of these 2009 pool locations did not meet the State criteria or the Federal criteria to be considered vernal pools in 2014-15 (VP 41B and VP 43). They either had insufficient indicators present and/or an insufficient hydroperiod. Also, one of these pools (VP 41B) appeared to be isolated and not part of a wetland. The remaining nine vernal pools are identified as VP \(2,3,4,5,6,7,8,42\) and 46.

Finally, a table is included showing all of the vernal pools in the study area.

\section*{NEW HAMPSHIRE CODE OF ADMINISTRATIVE RULES}

Env-Wt 101.105 "Upland buffer" means an area of land that is contiguous to a jurisdictional resource and that contributes to the functions and values of that resource.

> Source. (See Revision Notes \#2 and \#3 at chapter heading for Env-Wt 100) \#8340, eff 4-25-05; renumbered by \#9094 (from Env-Wt 101.96 to Env-Wt 101.97); renumbered by \#9131 (from Env-Wt 101.97 to Env-Wt 101.100); renumbered by \#9713 (from Env-Wt 101.100 to Env-Wt 101.106 )

Env- Wt 101.106 "Vernal pool" means a surface water or wetland, including an area intentionally created for purposes of compensatory mitigation, which provides breeding habitat for amphibians and invertebrates that have adapted to the unique environments provided by such pools and which:
(a) Is not the result of on-going anthropogenic activities that are not intended to provide compensatory mitigation, including but not limited to:
(1) Gravel pit operations in a pit that has been mined at least every other year; and
(2) Logging and agricultural operations conducted in accordance with all applicable New Hampshire statutes and rules; and
(b) Typically has the following characteristics:
(1) Cycles annually from flooded to dry conditions, although the hydroperiod, size, and shape of the pool might vary from year to year;
(2) Forms in a shallow depression or basin;
(3) Has no permanently flowing outlet;
(4) Holds water for at least 2 continuous months following spring ice-out;
(5) Lacks a viable fish population; and
(6) Supports one or more primary vernal pool indicators, or 3 or more secondary vernal pool indicators.

Source. \#9131, eff 4-19-08; renumbered by \#9713 (from Env-Wt 101.99 to Env-Wt 101.105)
Env-Wt 101.107 "Watercourse" means any surface water that:
(a) Develops and maintains a defined scoured channel, with evidence of sediment transport, that:
(1) Is greater than 75 feet in length; or
(2) Is of any length and connected to another jurisdictional area at either end; and
(b) Is not a drainage swale.

Source. \#9713, eff 5-12-10
Env-Wt 101.108 "Watershed" means a geographical area in which all water drains to a given stream, lake, wetland, estuary, or ocean.

Source. (See Revision Notes \#2 and \#3 at chapter heading for Env-Wt 100) \#8340, eff 4-25-05; renumbered by \#9094 (from Env-Wt 101.97 to Env-Wt 101.98); renumbered by \#9131 (from Env-Wt 101.98 to Env-Wt 101.101);
facilitate moorage of vessels where such areas have been established for that purpose by the U.S. Coast Guard, provided:
- Placement in the area is away from vegetated shallows
- If the above isn't possible, proper/eco-friendly moorings are used so chains or other connections don't rest on the bottom in veg. shallows 15 .
- Float stops, chains, or other devices must be used to provide \(\geq 2.5\)-foot clearance between the bottom of the float and the substrate during all tides

Scientific measurement devices, and small weirs and flumes constructed primarily to record water quantity and velocity provided the discharge of fill is limited to 10 cubic yards. No work may restrict movement of aquatic species or potentially threaten to impact or entangle sea turtles or marine mammals in near-coastal waters.

Survey activities including core sampling, seismic exploratory operations, plugging of seismic shot holes, other exploratory-type bore holes and oil and gas test wells, soil survey and sampling, and historic resources surveys. Discharges and structures associated with the recovery of historic resources are not authorized. Drilling and the discharge of excavated material from test wells for oil and gas exploration are not authorized. Fill placed for roads, pads and other similar activities is not authorized, nor is any permanent structure.

\section*{End Notes/Definitions}
\({ }^{1}\) Bordering and Contiguous Wetlands: A bordering wetland is immediately next to its adjacent waterbody and may lie at, or below, the OHW mark (MHW in navigable waters) of that waterbody and is directly influenced by its hydrologic regime. Contiguous wetlands extend landward from their adjacent waterbody to a point where a natural or manmade discontinuity exists. Contiguous wetlands include bordering wetlands as well as wetlands that are situated immediately above the ordinary high water mark and above the normal hydrologic influence of their adjacent waterbody. Note, with respect to the Federally designated navigable rivers, the wetlands bordering and contiguous to the tidally influenced portions of those rivers are reviewed under "II. Navigable Waters."
\({ }^{\mathbf{2}}\) Regulation: Either DES or NHCP must regulate an activity for it to be eligible for authorization as a Minimum Impact Project of this NH PGP. The Minimum Impact Project category does not apply to activities exempt from State regulation. These activities must report to the Corps.
\({ }^{3}\) Direct, Secondary (Indirect), and Cumulative Impacts:
Direct Impacts: The immediate loss of aquatic ecosystem within the footprint of the fill.
Secondary (Indirect) impacts: These are effects on an aquatic ecosystem that are associated with a discharge of dredged or fill materials, but do not result from the actual placement of the dredged or fill material. ( 40 CFR \(230.11(\mathrm{~h})\) ). Secondary impacts are those impacts outside the footprint of the fill (e.g., beyond the bounds of the disposal site) that arise from and are associated with the direct discharge of dredged or fill material. Some examples are: I) Habitat Fragmentation. This occurs when a relatively undisturbed habitat block is interrupted or broken apart by roads, ditches, disturbance of vegetation, or development of structures. II) Interruption of Travel Corridors. Travel corridors are routes that many species travel on to find food, mates, shelter, and cover. Many aquatic species follow stream channels and wetlands, and follow established routes season after season. III) Vernal Pools. These are critically important breeding habitats for amphibians. Many amphibians disperse several hundred feet from their breeding ponds into the adjacent upland habitat after the breeding season has ended. IV) Hydrology, hydrological functions and non-point source impacts: A) Interference with the migration or movement of fish and shellfish from one area to another, such as placement of a dam eliminating access to spawning grounds for anadromous fish. B) Greater amounts of sediment, nutrients, and other pollutants such as lead, oil, gas, and salt that could impact wetlands and streams. Sediment causes turbidity, which reduces aquatic life and usually transports pesticides, heavy metals and other toxins into streams. This is especially a concern in watersheds where the streams are already listed as impaired by NHDES. C) Submerged NE PGP - Appendix A
aquatic vegetation is very dependent on light transmission and small changes in ambient turbidity can preclude it from growing in certain areas. D) Trout spawning areas are selected in areas that are well flushed and aerated, and new amounts of deposition may result in a spawning area being eliminated due to siltation of fish eggs. E) Physical effects such as erosion, accretion, entrenchment, sedimentation, embedment, channel or shoreline migration and failure to pass bedload material, organic matter and large woody debris.
Cumulative Impacts: The extent of past, present, and foreseeable developments in the area may be an important consideration in evaluating the significance of a particular project's impacts. Although the impacts associated with a particular discharge may be minor, the cumulative effect of numerous similar discharges can result in a large impact. Cumulative impacts should be estimated only to the extent that they are reasonable and practical.
\({ }^{4}\) Incidental Fallback: The term "discharge of dredged or fill material" also includes certain discharges resulting from excavation.
\({ }^{5}\) Water Diversions: Water diversions are activities such as bypass pumping or water withdrawals. Temporary flume pipes, culverts or cofferdams where normal flows are maintained within the stream boundary's confines aren't water diversions. "Normal flows" are defined as no change in flow from pre-project conditions. See GC 21.
\({ }_{7}^{6}\) Special Aquatic Sites: These include both inland \& salt marsh wetlands, mud flats, vegetated shallows \({ }^{15}\), coral reefs, and riffle \& pool complexes. (40 CFR 230).
\({ }^{7}\) Special Wetlands: These include 1. enriched/calcareous seepage swamps, estuarine wetlands, floodplains, peatlands, unique basin swamps/marshes, and vernal pools, 2 . all wetlands that provide habitat for threatened or endangered species, and 3 . all exemplary wetland natural community occurrences as designated by the NH Natural Heritage Bureau (NHNHB). The wetland types provided in 1 above are expanded below and fully described in Natural Community Systems of New Hampshire and Natural Communities of New Hampshire, which are available at www.nhnaturalheritage.org. Note: The Corps will use the definition of vernal pools that is listed below, not the definition in the referenced Natural Heritage documents. The applicant is required to have NHNHB check the wetland types listed in 2 and 3 above by either requesting a hard copy review or using the DataCheck Tool at www.nhnaturalheritage.org.
\(\rightarrow \quad\) Vernal Pool (VP) and Habitat: VPs are confined basin depressions with water for two or more continuous months in the spring and/or summer, for which evidence of one or more of the following indicator vernal pools species: wood frogs (Rana sylvatica), mole salamanders (Ambystoma spp), and fairy shrimp (Eubranchipus spp) has been documented OR for which evidence of two or more of the following facultative organisms: caddisfly (Trichoptera) larvae casings, fingernail clams (Sphaeriidae), or amphibious snails (Basammatophora) and evidence that the pool does not contain an established reproducing fish population has been documented. Vernal pool habitat is the seasonal pool depression, seasonal pool envelope ( 100 FT radius from the VP edge) and seasonal pool terrestrial habitat ( 750 FT radius from the VP edge). The Corps will determine on a case-by-case basis which vernal pools are within their jurisdiction. Enriched/Calcareous seepage swamps: Wetlands characterized by the discharge of enriched groundwater. Floristic composition is an indicator of these conditions.
- Calcareous sloping fen system
- Calcareous riverside seep (natural community)
- Circumneutral seepage swamp (natural community)
- Red maple-black ash-swamp saxifrage swamp (natural community)
- Circumneutral hardwood forest seep (natural community)
- Northern hardwood-black ash-conifer swamp (natural community) Estuarine wetlands: Wetland communities occurring in subtidal and intertidal coastal habitats connected to the ocean but semi-enclosed by land and protected from high-energy wave action. These wetlands are periodically exposed and flooded by tides.
- Salt marsh system
- Brackish tidal riverbank marsh system
- Sparsely vegetated intertidal system
- Subtidal system

Floodplains: Areas of low land along a watercourse that are subject to periodic flooding and sediment deposition.
- Montane/near borcal floodplain system
- Major river silver maple floodplain system
- Temperate minor river floodplain system
- Swamp white oak floodplain forest (natural community)

Peatlands: Peat-accumulating wetlands, including bogs, fens, cedar swamps, which are often dominated with sphagnum moss, heath family plants and sedges.
- Alpine/subalpine bog system
- Kettle hole bog system

\end{tabular}
a First survey April 22 to 28; second visit May 7 and 8, 2009.
b NH Env-Wt. 101.86 and 101.87.
c USACE, NH PGP vernal pool facultative indicators.
d 1-Isolated depression 2-associated with wetland complex.
e Supports one or more primary vernal pool indicators, or 3 or more secondary vernal pool indicators (Env-Wt. 101.108).
f Evidence of one or more indicator vernal pool species (primary) or evidence of two or more facultative species (footnote b), (USACE, 2012).

Gaps in vernal pool IDs indicate pools eliminated from consideration as vernal pools under both USACE and NHDES criteria.

\section*{Qualitative Values:}
h=high productivity ( 20 or more WF, SS or BS egg masses; or fairy shrimp present
m=medium productivity ( 10 to 19 WF , SS, or BS egg masses)
I=low productivity (<10 WF, BS, or SS egg masses)

\section*{Pool Attributes:}
+ = fairy shrimp present BS=blue-spotted salamander

SS=spotted salamander
WF=wood frog
NR=Not Recorded
\# = 20 or more wood frog egg masses present
* \(=20\) or more spotted salamander or blue-spotted salamander egg masses present
tp \(=\) tadpole

\section*{Appendix J: Wetlands and Vernal Pools Functions and Values}

Wetlands proposed to be impacted by each alternative were reviewed to determine what functions and values the wetland currently provides that may be affected by construction of each alternative. The Highway Methodology Workbook Supplement (USACE, 1999) recognizes up to 13 different functions and values, including:
- Groundwater recharge/discharge; GW
- Floodflow Alteration; FA
- Fish and Shellfish habitat; FS
- Sediment/toxicant retention; SR
- Nutrient removal/retention/transformation; NR
- Production Export; PE
- Sediment/shoreline stabilization; SS
- Wildlife habitat; WH
- Recreation; RE
- Education/scientific value; ED
- Uniqueness/Heritage; UH
- Visual Quality/aesthetics; VQ and
- Endangered Species; ES

Results of the impact review follow. In accordance with Highway Methodology practices, functions are either assigned a P, for Primary Function provided by the wetland, an X for function provided by the wetland, or left blank to indicate that the function is not provided by the wetland.

NH Natural Heritage Bureau NHB Datacheck Results Letter

To: Sarah Barnum, Normandeau Associates
25 Nashua Rd
Bedford, NH 03110

From: Amy Lamb, NH Natural Heritage Bureau
Date: \(\quad 4 / 4 / 2016\) (valid for one year from this date)
Re: Review by NH Natural Heritage Bureau
NHB File ID: NHB16-0960 Town: Derry, Londonderry Location: North End of project area

Description: I-93 Exit 4A Project: This is a re-evaluation request from previous submittals in 2010, 2005 and 1999. This review is intended to ensure data presented in the project's Final Environmental Impact Statement (FEIS) is up to date. Project proposes to construct a new interchange one mile north of Exit 4 on Interstate 93 in Londonderry and Derry, NH. New interchange would consist of an easterly-only new construction access road that would connect with Folsom Road and then traverse east along Folsom and Tsienneto Roads. Work along Tsienneto Road would typically result in slight adjustments to easterly end of roadway and intersection improvements with Rt 28, Bypass Route 28, and Rt 102. We request that the five remaining alternatives within this study be evaluated to ensure they are each provided the most recent NHNHB review for sensitive plants and animals (Alternatives A through D and F).
cc: Kim Tuttle

As requested, I have searched our database for records of rare species and exemplary natural communities, with the following results
Comments: Please coordinate with NH Fish \& Game and the NHB to avoid and minimize impacts to the species and exemplary natural systems below.

Natural Community
Medium level fen system*

\section*{State \(^{1}\) Federal Notes}

Level fens are stagnant, and as such are characterized by low nutrient levels, relatively high acidity levels, and accumulations of peat. The primary threats to this community are changes to its hydrology (especially that which causes pooling), increased nutrient input from stormwater runoff, and sedimentation from nearby disturbance.
Poor level fen/bog system*

\section*{Plant species}

Dwarf Huckleberry (Gaylussacia bigeloviana)*

Level fens are stagnant, and as such are characterized by low nutrient levels, relatively high acidity levels, and accumulations of peat. The primary threats to this community are changes to its hydrology (especially that which causes pooling), increased nutrient input from stormwater runoff, and sedimentation from nearby disturbance.

\section*{State \({ }^{1}\) Federal Notes}

T

The primary threats are changes to this species' peatland habitat, including changes to

local hydrology, increased nutrient input from stormwater runoff, and sedimentation from nearby disturbance.
red threeawn (Aristida longespica var. geniculata)* E
The pond or lake shore natural communities where this species occurs are extremely vulnerable to trampling, and tend to disappear from areas that experience even moderate recreational use. They are also vulnerable to changes to the lake's hydrology. Additional habitats include sandplains and disturbed openings.

\({ }^{1}\) Codes: "E" = Endangered, "T" = Threatened, "SC" = Special Concern, "--" = an exemplary natural community, or a rare species tracked by NH Natural Heritage that has not yet been added to the official state list. An asterisk (*) indicates that the most recent report for that occurrence was more than 20 years ago.
Contact for all animal reviews: Kim Tuttle, NH F\&G, (603) 271-6544.
A negative result (no record in our database) does not mean that a sensitive species is not present. Our data can only tell you of known occurrences, based on information gathered by qualified biologists and reported to our office. However, many areas have never been surveyed, or have only been surveyed for certain species. An on-site survey would provide better information on what species and communities are indeed present.

\title{
New Hampshire Natural Heritage Bureau - System Record \\ Medium level fen system
}

Legal Status
Federal: Not listed
State: Not listed

Conservation Status
Global: Not ranked (need more information)
State: Rare or uncommon

\section*{Description at this Location}

Conservation Rank: Historical records only - current condition unknown.
Comments on Rank:

Detailed Description: 1992: Closer to the pond edge, the heath shrubs are shorter or dwarfed and dominated by Chamaedaphne calyculata (leatherleaf) and Myrica gale (sweet gale), with Rhododendron canadense (rhodora) most common along the high-shrub border. Small pockets of open sphagnum moss and sedges are found near the inlet stream and pond edge, with a greater diversity of species apparent. Species found in these areas include Carex trisperma (threeseeded sedge), Andromeda polifolia var. glaucophylla (bog rosemary), Eriophorum virginicum (tawny cotton-grass), Vaccinium macrocarpon (large cranberry), Drosera intermedia (spatulate-leaved sundew), and Peltandra virginica (arrow arum). Nuphar variegata (variegated yellow pondlily), Nymphaea odorata (white waterlily), and Brasenia schreberi (water shield) are found along the edges of the floating mat.
General Area: 1992: The northwest side of Scobie Pond has an approximate 8-acre basin with several associations including hardwood-conifer basin swamp, high shrub bog, dwarf heath-shrub bog and acidic fen communities represented. Collectively, they form a level bog ecosystem. The rare gaylussacia dumosa var bigeloviana was sought but not found, although the habitat appeared appropriate for it. A vernal pond is found about 100 yards SSW from the Cardinal Road cul de sac.
General Comments:
Management
1992: Housing expansion to north/northeast of the pond could present threats to the ecosystem water quality. Houses on the pond appear to be relatively benign in terms of direct threats, but water quality impacts are uncertain.

\section*{Location}

Survey Site Name: Scobie Pond
Managed By:
County: Rockingham
Town(s): Londonderry
Size: 34.2 acres Elevation: 360 feet
Precision: Within (but not necessarily restricted to) the area indicated on the map.
Directions: 1992: Site was accessed from end of Cardinal Road off of Partridge Road. (junction at Derry/Londonderry line) off of Old Derry Road. May be better access from elsewhere.

New Hampshire Natural Heritage Bureau - System Record \\ Poor level fen/bog system
}

\section*{Legal Status}

Federal: Not listed
State: Not listed

Conservation Status
Global: Not ranked (need more information)
State: Rare or uncommon

\section*{Description at this Location}

Conservation Rank: Historical records only - current condition unknown.
Comments on Rank:
Detailed Description: 1992: Population of Gaylussacia dumosa var bigeloviana was found in the fen community.
General Area: he classic fen sequence of floating mat, open peat, low heath, tall heath, dwarf spruce and larch, and shrub swamp is found in this wetland complex. The lag varies from 20 to over 200 feet wide, although the low and high heath zones are not always well developed. The dominant plant in the low heath where the dwarf huckleberry was found was leatherleaf. Dwarf black spruce and larch are scattered throughout this zone. The shrub swamp further back from the pond is dominated by mountain holly, winterberry holly, and high bush blueberry.
General Comments:

New Hampshire Natural Heritage Bureau - Plant Record Dwarf Huckleberry (Gaylussacia bigeloviana)
}

\section*{Legal Status}

Federal: Not listed
State: Listed Threatened

\section*{Conservation Status}

Global: Apparently secure but with cause for concern
State: Imperiled due to rarity or vulnerability

\section*{Description at this Location}

Conservation Rank: Historical records only - current condition unknown.
Comments on Rank:

Detailed Description: 1992: Ca. 200 plants seen, 60 percent with mature fruit and dispersing seed, 30 percent in leaf. Growing at the bottom of a slope in wet-mesic condition. May be more plants scattered through the leatherleaf.
General Area: 1992: The huckleberry was found on a low heath mat that rings a portion of the shallow water pond. The classic fen sequence of floating mat, open peat, low heath, tall heath, dwarf spruce and larch, and shrub swamp, is found in this wetland complex. The dominant plant in the low heath where the the dwarf huckleberry was found was Chamaedaphne calyculata. Dwarf Picea mariana, and Larix larcina are scattered throughout this zone. The shrub swamp further back from the pond is dominated by Nemopanthus mucronata, Ilex verticillata, and Vaccininium corymbosum.

\section*{Memo}

NH Natural Heritage Bureau NHB Datacheck Results Letter

To: Sarah Barnum, Normandeau Associates
25 Nashua Rd
Bedford, NH 03110

From: Amy Lamb, NH Natural Heritage Bureau
Date: \(4 / 4 / 2016\) (valid for one year from this date)
Re: Review by NH Natural Heritage Bureau
NHB File ID: NHB16-0961 Town: Derry, Londonderry Location: South end of project area

Description: I-93 Exit 4A Project: This is a re-evaluation request from previous submittals in 2010, 2005 and 1999. This review is intended to ensure data presented in the project's Final Environmental Impact Statement (FEIS) is up to date. Project proposes to construct a new interchange one mile north of Exit 4 on Interstate 93 in Londonderry and Derry, NH. New interchange would consist of an easterly-only new construction access road that would connect with Folsom Road and then traverse east along Folsom and Tsienneto Roads. Work along Tsienneto Road would typically result in slight adjustments to easterly end of roadway and intersection improvements with Rt 28, Bypass Route 28, and Rt 102. We request that the five remaining alternatives within this study be evaluated to ensure they are each provided the most recent NHNHB review for sensitive plants and animals (Alternatives A through D and F).
cc: Kim Tuttle

As requested, I have searched our database for records of rare species and exemplary natural communities, with the following results.

\title{
Comments: This site is within an area flagged for possible impacts on the state-listed Alasmidonta varicosa (brook floater) in Beaver Brook. Please coordinate with NH Fish \& Game and the NHB to avoid and minimize impacts to the species below.
}

A negative result (no record in our database) does not mean that a sensitive species is not present. Our data can only tell you of known occurrences, based on information gathered by qualified biologists and reported to our office. However, many areas have never been surveyed, or have only been surveyed for certain species. An on-site survey would provide better information on what species and communities are indeed present.

\title{
New Hampshire Natural Heritage Bureau - Plant Record \\ bird-foot violet (Viola pedata)
}

\section*{Legal Status}

Federal: Not listed
State: Listed Threatened

\section*{Conservation Status}

Global: Demonstrably widespread, abundant, and secure
State: Imperiled due to rarity or vulnerability

\section*{Description at this Location}

Conservation Rank: Fair quality, condition and/or landscape context ('C' on a scale of A-D).
Comments on Rank: Large population but site highly disturbed and likely to be developed.
Detailed Description: 2010: Area 1: A house has been built on lot and area loamed and seeded. Several clumps observed on roadsides of lot.Area 2: 630 clumps, \(60 \%\) in fruit. Seed collection for NEWFS undertaken ( \(6 / 7\) and \(6 / 9\) ). Very healthy population.2006: Area 1: About 300 clumps estimated - as abundant as in 2005. Quite vigorous, and carpeted some areas (5/22). Observed and photographed (7/25).2005: Area 1: 250-300 clumps (often 5-7 in. diameter) estimated, clumped and scattered in a 0.5 acre area.
General Area: 2006: Area 1: In vacant lot. Other species in the vicinity include: Ionactis linariifolius (stiffleaved aster), Viola sagittata (arrow-leaved violet), Euthamia graminifolia (flat-topped goldenrod), Erigeron canadensis (horseweed), Schizachyrium scoparium (little bluestem), Potentilla canadensis (running field cinquefoil), Juncus greenei (Greene's rush), Helianthemum canadense (Canadian frostweed), Deschampsia flexuosa (common hairgrass), Betula populifolia (gray birch), Oenothera biennis (biennial evening primrose), Pinus strobus (white pine), Erigeron annuus (daisy fleabane), Nuttallanthus canadensis (blue toadflax), Solidago nemoralis (northern gray goldenrod), Dichanthelium linearifolium (linear-leaved panic grass), Solidago juncea (early goldenrod), Asclepias syriaca (common milkweed), and Hypericum gentianoides (orange grass).2005: Area 1: Vacant lot in the vicinity of Pinus strobus (white pine) and Pinus resinosa (red pine) woods. Associated species include Potentilla simplex (old-field cinquefoil), Potentilla canadensis (running field cinquefoil), Houstonia caerulea (bluets), Solidago spp. (goldenrod), Ionactis linariifolius (stiff-leaved aster), and Rumex acetosella (red sorrel). Lot is heavily disturbed: all trees removed, soil disturbed as stumps dragged around, slash dumped at one side.
General Comments:
Management
2006: At one lot after some trees were taken down (year unknown) the numbers of violets Comments: increased.

\section*{Location}

Survey Site Name: Pine Street
Managed By:
County: Rockingham
Town(s): Londonderry
Size: . 4 acres Elevation:
Precision: Within (but not necessarily restricted to) the area indicated on the map.
Directions: 2010: Area 2: From Route 128 (Mammoth Rd.) in Londonderry, head east onto Valley Street to residence at 8 Valley St.2006: Areas 1 and 2: [From Rte. 128 in Londonderry, head east onto Valley Street. Take a left onto Loop Rd. and then merge onto Pine Street. Park at vacant lot at 17 Pine Street]. Driving around neighborhood, clumps of violets observed growing on the roadsides.2005: Area 1: Take Rte. 102 to Mammoth Rd. south. Turn left on Valley St. Bear left on Loop Rd. which turns into Pine St.

\title{
New Hampshire Natural Heritage Bureau - Plant Record common star-grass (Hypoxis hirsuta)
}

\section*{Legal Status \\ Federal: Not listed \\ State: Listed Threatened \\ Description at this Location \\ General Comments:}

\section*{Conservation Status}

Global: Demonstrably widespread, abundant, and secure
State: Imperiled due to rarity or vulnerability

Conservation Rank: Good quality, condition and landscape context ('B' on a scale of A-D).
Comments on Rank: Moderate population in an artificially maintained habitat.
Detailed Description: 2010: 84 flowering stems marked and counted, scattered in a \(25 \times 50\)-foot area.
General Area: 2010: Rich, wet meadow, artificially maintained by annual mowing.
Management 2010: Purple loosestrife is a problem. Plants have been pulled for a number of years and Comments: beatles were released in 2009. The area has to be mowed in the fall. Also managed for pale green orchid (Platanthera flava var. herbiola) and fringed gentian (Gentianopsis crinita).

New Hampshire Natural Heritage Bureau - Plant Record \\ Downy Arrowwood (Viburnum rafinesquianum)
}

\section*{Legal Status}

Federal: Not listed
State: Listed Endangered

Conservation Status
Global: Demonstrably widespread, abundant, and secure
State: Critically imperiled due to rarity or vulnerability

\section*{Description at this Location}

Conservation Rank: Historical records only - current condition unknown.
Comments on Rank: Very small population compared to Howe Hill in Derry and Hampstead.
Detailed Description: 1991: 11-50 plants, \(5 \%\) with mature fruit. Some of these shrubs were up to 6 feet tall.
General Area: 1991: Growing alongside a narrow seepage swamp. Appears to be some ecological differences in this relatively small area of the forest as indicated by different species found here.
General Comments: 1991:1 small population found. No more in vicinity, but possibly a "mother" population somewhere in surrounding woods.
Management 1991: Evidence of human disturbance nearby - some cutting and dirt roads.
Comments:

\title{
New Hampshire Natural Heritage Bureau - Plant Record \\ northern tubercled bog-orchid (Platanthera flava var. herbiola)
}

\section*{Legal Status}

Federal: Not listed
State: Listed Endangered

\section*{Conservation Status}

Global: Apparently secure but with cause for concern
State: Critically imperiled due to rarity or vulnerability

\section*{Description at this Location}

Conservation Rank: Fair quality, condition and/or landscape context ('C' on a scale of A-D).
Comments on Rank: Moderate population size on conservation land being managed for multiple rare plants. 2003:
(D) Single plant.

Detailed Description: 2010: 33 flowering stems, scattered in groups. Smaller stature due to droughty conditions.2009: 44 flowering stems, normal vigor.2003: One plant, in flower.
General Area: 2010: Rich, wet meadow artificially maintained by annual mowing. Associated species include old-field cinquefoil (Potentilla simplex), purple avens (Geum rivale), large cranberry (Vaccinium macrocarpon), asters (Symphyotrichum sp.), goldenrods (Solidago sp.), and various garminoids.2003: Wet meadow, inundated in spring. Associated plants include Scirpus cyperinus (woolly bulrush), Lythrum salicaria (purple loosestrife), Salix sp. (willow), Sanguisorba canadensis (Canadian burnet), and Hypoxis hirsuta (hairy star-grass).
General Comments: 2010: American copper butterflies were pollinating the flowers.2003: Meadow mowed by accident 7-10 days after the survey. Status of the orchid unknown.
Management 2010: Area being managed by the Londonderry Conservation Commission in co-operation Comments: with the NEWFS Plant Conservation Volunteer program. There is a purple loosestrife problem. We have been pulling for a number of years and released beetles in 2009. The pale green orchid area has been kept as clear as possible, but mowing probably offers a vector for continued seed dispersal. Area has to be mowed in the fall as it is also home to hairy stargrass (Hypoxis hirsuta) and fringed gentian (Gentianopsis crinita).

In Reply Refer To:
June 20, 2018
Consultation Code: 05E1NE00-2017-SLI-0288
Event Code: 05E1NE00-2018-E-04980
Project Name: I-93 Exit 4A
Subject: Updated list of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

\section*{To Whom It May Concern:}

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations ( 50 CFR 402 et seq.), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2) (c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:
http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF
Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 et seq.), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/ eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http:// www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http:// www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/ comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):
- Official Species List

\section*{Official Species List}

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:
New England Ecological Services Field Office

Project Name: I-93 Exit 4A
Project Type: TRANSPORTATION
Project Description: The Towns of Derry and Londonderry, New Hampshire (NH), and the Federal Highway Administration (FHWA) are studying the construction of a new Interstate 93 (I-93) Interchange, known as Exit 4A, that would provide access to only areas east of I-93 along with a new roadway connecting the proposed Exit 4A with the existing roadway network.

Project Location:
Approximate location of the project can be viewed in Google Maps: https://
www.google.com/maps/place/42.8821615762781N71.34204636632049W

Counties: Rockingham, NH

\section*{Endangered Species Act Species}

There is a total of 1 threatened, endangered, or candidate species on this species list.
Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries \({ }^{\underline{1}}\), as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.
1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

\section*{Mammals}

NAME STATUS
Northern Long-eared Bat Myotis septentrionalis
Threatened
No critical habitat has been designated for this species.

\author{
Dear Mr. Bauer:
}

On November 9, 2016, we received your letter asking if we have an interest in becoming a participating agency with FHWA for the development of your Supplemental Draft Environmental Impact Statement (SDEIS).

\section*{Endangered Species Act (ESA)}

We do not expect'any federally listed or proposed threatened or endangered species nor critical habitat under our jurisdiction to occur in the vicinity of the proposed project; therefore, no direct or indirect effects are expected. The Protected Resources Division does not intend to offer additional comments on this project. For the future, if you are looking for information relevant to ESA-listed species and critical habitat, please visit our website at: https://www.greateratlantic.fisheries.noaa.gov/protected/section7/ If you wish to discuss this further, please contact Zachary Jylkka (978-282-8467;
Zachary.Jylkka@noaa.gov).
Magnuson-Stevens Fishery Conservation and Management Act
The proposed project area does not contain areas identified as Essential Fish Habitat (EFH) under the Magnuson-Stevens Fishery Conservation and Management Act. Therefore, we do not intend to provide EFH conservation recommendations to you for this action. For a listing of EFH and further information, please go to our website at:
http://www.greateratlantic.fisheries.noaa.gov/habitat. If you wish to discuss this further, please contact Mike Johnson (978-281-9130; Mike.R.Johnson@noaa.gov) of our Habitat Conservation Division.

Subject: NH DOT I-93 Exit 4A Project Comments

Mr. Cota,
We received your letter on July 13, 2018, regarding the I-93, exit 4A project in Derry, NH. Here are our comments.

\section*{Endangered Species Act}

No federally listed or proposed threatened or endangered species under our jurisdiction are known to exist in the site of your proposed project. Based on this, we do not believe a consultation in accordance with section 7 of the Endangered Species Act is necessary. As such, no further coordination on this activity with the NMFS Protected Resources Division is necessary at this time. Should project plans change or new information become available that changes the basis for this determination, further coordination should be pursued. Please contact me (978) 282-8490 or Edith.Carson@noaa.gov), should you have any questions regarding these comments.

\section*{Magnuson-Stevens Fishery Conservation and Management Act}

The proposed project area does not contain areas identified as Essential Fish Habitat (EFH) under the Magnuson-Stevens Fishery Conservation and Management Act. Therefore, we do not intend to provide EFH conservation recommendations to you for this action. For a listing of EFH and further information, please go to our website at:
http://www.greateratlantic.fisheries.noaa.gov/habitat. If you wish to discuss this further, please contact Mike Johnson (978-281-9130; Mike.R.Johnson@noaa.gov) of our Habitat Conservation Division.

Thank you,

Subject: LWCF Properties in Derry, NH

Mr. Gegas,
As we discussed, Louis Berger is conducting the Supplemental Draft EIS for the proposed I-93 Exit 4A project. As part of the evaluation, we are identifying properties near the alternative alignments that have received money from the Land and Water Conservation Fund. Attached is a map showing parks and recreation resources near the alternative alignments. From our research, we have noted that the Veteran's \& O'Hara Ball Fields appear to have received LWCF money (Parcel ID 2). Are there any other properties in the following table that have received LWCF money? Are there any other properties in proximity to the alignments that we may have missed?
\begin{tabular}{|c|l|l|c|}
\hline Parcel ID & \multicolumn{1}{|c|}{ Name } & \multicolumn{1}{|c|}{ Location } & LWCF Recipient? \\

Mr. Eric Bodenrader
Parks and Recreation Director
Veterans Hall
31 West Broadway
Derry, NH 03038

Re: Derry-Londonderry 13065 I-93 Exit 4A Environmental Impact Statement FHWA Intent to Make a Section 4(f) de minimis determination

Dear Mr. Bodenrader:
This letter is in regard to Section 4(f) coordination for the I-93 Exit 4A project. Per 23 CFR 774.5, we are coordinating with you as the official with jurisdiction responsible for Section 4(f) recreational resources in the Town of Derry.

The Towns of Derry and Londonderry, the New Hampshire Department of Transportation ( NHDOT) and Federal Highway Administration (FHWA) are preparing a Supplemental Draft Environmental Impact Statement (SDEIS) under the National Environmental Policy Act (NEPA) for the proposed I-93 Exit 4A (Project). The Project includes construction of a new interchange with I-93 (known as Exit 4A) and other transportation improvements to reduce congestion and improve safety along State Route 102 (NH 102), from l-93 easterly through downtown Derry, and to promote economic vitality in the Derry/Londonderry area. The Preferred Alternative for the Project is Alternative A (Figure 1).

\section*{Parks and Recreational Resources - Rider Fields}

The Project involves the improvement of Tsienneto Road, which would require permanent acquisition of 920 square feet (0.02 acre) of the Rider Fields property adjacent to the existing roadway. The Project would result in slope and driveway impacts beyond the proposed right of way (ROW) that would require additional, temporary easements of 2,500 square feet ( 0.06 acre) on the Rider Field property (Figure 2).

Within the permanent acquisition area, the following items will be disturbed:
- Stone wall spanning between the parcel to the west ( 34 Tsienneto Rd) and this parcel
- The tree west of the driveway to the Upper Room
- The mailbox
- The sign for the Upper Room Family Resource Center
- The landscaping blocks around a landscaped area
- Stone wall between the Upper Room Family Resource Center driveway and the Rider Fields driveway
- The end of the culvert under Tsienneto Road between the driveways
- The ditch between the driveways (approximately 15 linear feet)

The impacts associated with the temporary easement are limited to the vegetation between the Upper Room driveway and the Rider Fields driveway. This vegetated area near Tsienneto Rd. is not typically used for recreational purposes by the public and is approximately 346 feet from the sports fields to the north that constitute the primary recreational area of the park.

NHDOT will coordinate with the Town of Derry to move the mailbox and sign for the Upper Room Family Resource Center and to replace the stone walls and vegetation that would be impacted by the Project. The temporary easement would not impact the usability of park and access to the park would be maintained throughout the construction period. Neither the Upper Room Family Resource Center nor the activities, features, and attributes of the Rider Fields would be adversely impacted on a permanent or temporary basis.

\section*{De Minimis Finding}

As a part of the environmental review process, the FHWA has responsibilities to comply with Section 4(f) of the Department of Transportation Act of 1966 (which has been later revised and recodified but still referred to as Section \(4(\mathrm{f})\) ). The intent of the Section \(4(\mathrm{f})\) Statute, 49 U.S.C. Section 303, and the policy of the FHWA is to avoid transportation use of historic sites and publicly owned recreational areas, parks, and wildlife and waterfowl refuges. If the FHWA determines that a transportation use of these types of properties, also known as Section 4(f) properties, results in a de minimis impact on that property, an analysis of avoidance alternatives is not required, and the Section \(4(\mathrm{f})\) evaluation process is complete. De minimis impacts on publicly owned parks, recreation areas, and wildlife and waterfowl refuges are defined as those that do not "adversely affect the activities, features and attributes" of the Section 4(f) resource.

The finding of a de minimis impact on recreational and wildlife resources can be made when:
1. The transportation use of the Section \(4(f)\) resource, together with any impact avoidance, minimization, and mitigation or enhancement measures incorporated into the project, does not adversely affect the activities, features, and attributes that qualify the resource for protection under Section 4(f);
2. The public has been afforded an opportunity to review and comment on the effects of the project on the protected activities, features, and attributes of the Section 4(f) resource; and
3. The officials) with jurisdiction over the property are informed of FHWA's intent to make the de minimis impact finding based on their written concurrence that the project will not adversely affect the activities, features, and attributes that qualify the property for protection under Section 4(f).

NHDOT respectfully requests concurrence that the Project will not "adversely affect the activities, features and attributes" that qualify the Rider Fields for protection, in order that FHWA can make a determination that the impacts to Rider Fields are de minimis. Per requirements of 23 CFR 774.5 (a)(2)(ii), the public will receive notice and an opportunity for public review and comment concerning the effects on park lands during the SDEIS public comment period.

Please contact me if you have any questions regarding this matter.

cc: Mike Fowler, Town of Derry, Director of Public Works
Jamie Sikora, FHWA

Project Name: I-93 Exit 4A
Subject: Updated list of threatened and endangered species that may occur in your proposed project location, and/or may be affected by your proposed project

\section*{To Whom It May Concern:}

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 et seq.).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations ( 50 CFR 402 et seq.), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2) (c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:
http://www.fws.gov/endangered/esa-library/pdf/TOC-GLOS.PDF
Please be aware that bald and golden eagles are protected under the Bald and Golden Eagle Protection Act (16 U.S.C. 668 et seq.), and projects affecting these species may require development of an eagle conservation plan (http://www.fws.gov/windenergy/ eagle_guidance.html). Additionally, wind energy projects should follow the wind energy guidelines (http://www.fws.gov/windenergy/) for minimizing impacts to migratory birds and bats.

Guidance for minimizing impacts to migratory birds for projects including communications towers (e.g., cellular, digital television, radio, and emergency broadcast) can be found at: http:// www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/towers.htm; http:// www.towerkill.com; and http://www.fws.gov/migratorybirds/CurrentBirdIssues/Hazards/towers/ comtow.html.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Tracking Number in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Attachment(s):
- Official Species List

\section*{Official Species List}

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:
New England Ecological Services Field Office
70 Commercial Street, Suite 300
Concord, NH 03301-5094
(603) 223-2541

\section*{Project Summary}

Consultation Code: 05E1NE00-2017-SLI-0288
Event Code: \(\quad 05 \mathrm{E} 1 \mathrm{NE} 00-2018-\mathrm{E}-04980\)
Project Name: I-93 Exit 4A
Project Type: TRANSPORTATION
Project Description: The Towns of Derry and Londonderry, New Hampshire (NH), and the Federal Highway Administration (FHWA) are studying the construction of a new Interstate 93 (I-93) Interchange, known as Exit 4A, that would provide access to only areas east of I-93 along with a new roadway connecting the proposed Exit 4A with the existing roadway network.

Project Location:
Approximate location of the project can be viewed in Google Maps: https://
www.google.com/maps/place/42.8821615762781N71.34204636632049W

Counties: Rockingham, NH

\section*{Endangered Species Act Species}

There is a total of 1 threatened, endangered, or candidate species on this species list.
Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries \({ }^{\underline{1}}\), as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.
1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

\section*{Mammals}

NAME STATUS
Northern Long-eared Bat Myotis septentrionalis
Threatened
No critical habitat has been designated for this species.
Species profile: https://ecos.fws.gov/ecp/species/9045

\section*{Critical habitats}

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

Table D-1. Reptile Species with Ranges Likely to Overlap the Study Area \({ }^{1}\)
\begin{tabular}{|c|c|c|c|c|c|}

\section*{Summary}

Ultrasonic acoustic surveys were conducted to inventory the federally threatened northern long-eared bat (NLEB; Myotis septentrionalis) within the I-93 Exit 4A interchange project area, located in the towns of Derry and Londonderry, New Hampshire (NH). The project route and route alternatives primarily follow existing ROW and road networks, spanning roughly 13 kilometers in length. Twelve of these kilometers were determined to potentially provide habitat for NLEB based on on-site visual assessments. Surveys were conducted from August 8 through August 15, 2016 within 12 pre-determined 1 kilometer segments. All segments were required to be surveyed a minimum of two detector nights, achieved with one detector per kilometer for two nights. Six of the segments were surveyed from Aug 8 to Aug 10, and six were surveyed from August 10 to August 12. The detector from Segment 3 (surveyed Aug 8-Aug 10) malfunctioned, and an additional two survey nights were needed. Bat calls were recorded at eleven of the twelve Segments, none of which returned positive results for NLEB. Other species likely to be present include big brown bat, eastern red bat, hoary bat, silver-haired bat, little brown bat, and tricolored bat.

\subsection*{1.0 Project Overview}

The Project consists of constructing the on and off ramps to I-93 and a connector road, and improvements to the existing roadway that the connector will join into. Five alternatives are under consideration, four of which would require varying amounts of tree clearing. Surveys assessed potentially suitable habitat for all four tree-clearing alternatives.

The project is within the range of the federally threatened and state threatened NLEB. This treeroosting bat uses forested habitats during its active season, from April 15 - October 31. The project has the potential to affect this species via tree clearing, which could reduce roosting habitat or potentially cause direct mortality if an occupied roost tree is felled when bats are present. Therefore, a survey compliant with the USFWS' 2016 Range-wide Indiana Bat Summer Survey Guidelines (Guidelines), which are also applicable to summer survey for NLEB, was conducted to determine if NLEB are present. Results of the survey are summarized below, and these results include all the elements requested in Appendix C of the 2016 Guidelines.

\subsection*{2.0 Methods}

The survey was conducted in conformance with the methods and approach outlined in the Guidelines. The field survey and the data analysis were conducted by personnel trained and qualified to conduct their respective tasks. Staff resumes are attached at the end of this document.

\section*{Habitat Assessment}

The general suitability of the habitat on this site was assessed by examining recent aerial photography of the site (Google Earth \({ }^{\mathrm{TM}}\) ) prior to deploying the detectors. In the field, the characteristics of the habitat were examined in all locations where acoustic detectors were placed, to confirm that suitable habitat was present. The desktop assessment was conducted by Sarah Barnum, Ph.D., CWB \({ }^{\circledR}\), and the on-site observations of the surrounding vegetation within the project area were conducted by acoustic survey technician Jamie O'Brien. Their resumes are attached to the end of this document, and results of the assessment are presented in Section 3.1.

\section*{Detector Deployment}

Normandeau conducted the survey using full-spectrum ultrasonic acoustic detectors. As defined by the Guidelines, this project was categorized as linear; therefore it was surveyed as 12 1-kilometer segments, requiring a minimum of two survey nights each. Detectors placed for Segments 1, 2, 4 through 7, and 9 were placed along existing power line right-of-ways. Detectors surveying Segments 3,10, and 12 were placed along roadsides, and detectors for segments 8 and 11 were placed along a small bike/foot path and the edge of town-owned recreation fields, respectively. All acoustic detectors were left in place to collect data on sequential nights with suitable weather conditions described in the Guidelines, yielding two detector nights of data for each segment.

The sampling locations were selected based on a combination of factors including access, best site conditions to deploy the equipment so that it would not be disturbed, an open cone of detection for the microphones to sample, and apparent bat habitat quality (e.g., mature trees, snags, hollows and crevices, and wetland habitat). The detector set-up adhered to specifications detailed in the Guidelines.

To ensure that the detectors were functioning correctly during every survey period, settings were checked upon retrieval of the detectors in a similar fashion as to when they are deployed: 1) the microphones were checked for proper recording of sounds and archival of data onto the internal drive/USB; and 2) the program recording times, detector limits, and acoustic range were verified.

\section*{Call Analysis}

The entire call analysis process was managed via Normandeau's ReBAT® data management system, which tracks each acoustic recording file after upload throughout the call analysis process and stores all results in a MySQL database. Each acoustic file was processed as required by the 2016 Guidelines using Kaleidoscope Pro v 3.1.4, zero crossing, which is one of the USFWS-approved automated bat call classification software packages. The software analyzes bat calls and determines the probability (or "likelihood of presence p (probability) value") that they were made by a certain bat species. Any probability less than 0.05 is statistically interpreted to mean that the call belongs to that species. Probabilities \(<1\) but \(>0.05\) indicate that calls of certain species were identified but the probabilities were not low enough to confirm presence, or that no calls of that specie were detected. If bat call files were identified by the
software package as belonging or potentially belonging to the NLEB, they were manually examined for final determination by Stephen Lindsay, a trained bat acoustic expert and call analyst. His resume is attached at the end of this document.

\subsection*{3.0 Results}

\subsection*{3.1 Overall Habitat Assessment}

The general location of the survey site is depicted in Figure A-1, Appendix A. Overall, the Project area consists of developed roads bordered by commercial and residential lots, as well as existing right-of-ways and undeveloped forest in the southwestern corner of the project area (Segments 7 and 8). A mix of forest cover types are present, but predominantly were composed of a hardwood/softwood tree mixture. Varying wetland cover types were also present, including emergent marshes and vernal pools close to some of the detector locations. Snags were present at many of the chosen survey locations, and structures such as an old bridge, residential houses, and commercial buildings provided potential roost alternatives. The on-site trees consisted primarily of northern red oak (Quercus rubra), Eastern white pine (Pinus strobus), red maple (Acer rubrum), sugar maple (Acer saccharum), and white oak (Quercus alba).

\subsection*{3.2 Deployment Details}

The survey was conducted from August 8 through August 15, 2016 and the detectors were programed to run from 19:32 UTC (coordinated universal time) until 6:01 UTC the following morning. One acoustic detector was placed in each of the 12 1-kilometer segments for two nights to capture a total of two detector nights per segment (Figure A-1, Appendix A). Detectors are placed at least 200 m apart, as per USFWS guidelines. Photos of the detector setups are presented in Appendix C. Details of the survey for each of the recording nights are summarized in Table 1 and specifications of the detectors and microphones used are summarized in Table 2.

Hourly weather conditions from Manchester Airport (KMHT), the NOAA weather reporting station nearest to Derry and Londonderry, are presented in Appendix B for each of the survey nights. Although weather was acceptable for each of the first four survey nights (Aug 8-Aug 12), malfunctions with the IFR unit at Segment 3 (i.e. recording device) added an additional three survey nights, as one of the additional nights failed due to weather.

Individual descriptions of the habitat in the locations where each detector was placed follow below, and pictures of the habitat are presented in Appendix C.
- Segment 1 - The detector at Segment 1 was deployed in an existing power line right-ofway facing northeast. The right-of-way had a well-established maintenance road throughout, and woody vegetation was generally less than five feet tall. Interstate 93 runs almost perpendicular to the right-of-way, approximately 330 feet west of the unit. Adjacent tree cover was a mix of hardwood and softwood trees. Species include eastern white pine (dominant), red maple, paper birch, northern red oak, and white oak. Average DBH was about 4-12" with larger trees scattered throughout.
- Segment 2 - The unit at Segment 2 was deployed in a forest patch approximately 15 feet from an existing power line right-of-way and roughly 150 feet from Rockingham Road. Along the forest edge, adjacent to the right-of-way, there was considerable slash, which prevented the detector being placed along this forest edge. The understory in the forest patch interior was mostly open with a 60-80 percent closed canopy. The detector, facing northwest, pointed toward a dry vernal pool. Tree species in the surrounding area included northern red oak (dominant), eastern white pine, white oak, red maple, and paper birch. Average DBH was about 3-10".
- Segment 3 - The unit was deployed in a small woodland patch between two commercial lots, off of Manchester Road. This forest patch was the best available survey location in this highly commercialized segment. The detector faced west away from the road and towards a more forested area approximately 200 feet from the unit. Trees were almost exclusively sugar maple, with a few eastern white pine, white ash, and northern red oak in the surrounding area. Average DBH was roughly \(8-18^{\prime \prime}\), with an open understory.
- Segment 4 - The unit at Segment 4 was placed along the edge of an existing power line right-of-way facing northeast over an emergent marsh, which was dry at the time of
survey. Surrounding forests were a mix of hardwood and softwood trees, with an average DBH of 6-12". Tree species included eastern white pine (dominant), red maple, yellow birch, and northern red oak. Snags were present at this location.
- Segment 5 - The unit at Segment 5 was placed facing northeast along an existing power line right-of-way. The adjacent forest cover was a mix of hardwood and softwood trees. A stand of snags was located approximately 100 feet southwest of the unit. Dominant tree species within the area included northern red oak, followed by eastern white pine, sugar maple, and white birch. Average DBH was approximately 8-16".
- Segment 6 - The unit was placed along an existing power line right-of-way facing east towards an emergent marsh. Roughly one half-dozen snags were located within 50 feet of the detector. Surrounding forest area was a mix of hardwood and softwood trees, with an average DBH of 6-12". Tree species included eastern white pine (dominant), ash, yellow birch, eastern hemlock, red maple, and northern red oak.
- Segment 7 - The detector at Segment 7 was placed along an existing power line right-ofway facing east in a large emergent marsh and connecting (dry) vernal pool. This location was approximately 350 feet from Interstate 93. Adjacent forest cover included a mix of hardwood and softwood trees, including eastern hemlock (dominant), yellow birch, eastern white pine, red maple, northern red oak, and paper birch. Snags were scattered throughout and average DBH was about 5-12".
- Segment 8 - The unit was deployed along a small foot/bike path facing northwest. In this direction was a wooden bridge approximately 500 feet from the detector. Habitat surrounding the unit was a mix of hardwood and softwood trees, with hardwoods being more abundant. Dominant tree species were northern red oak, followed by quaking aspen, American elm, eastern hemlock, sugar maple, and eastern white pine. Average DBH was about 8-14", with a 60-80 percent closed canopy.
- Segment 9 - The detector was placed along the west side of an existing power line right-of-way, facing southeast. Forest cover toward the south was predominantly hardwood trees with a closed canopy and moderately dense understory. Some snags were present, and a vernal pool was across the right-of-way, about 300 feet east of the detector. Tree species included northern red oak (dominant), sugar maple, eastern white pine, hickory, and sweet birch. Average DBH was roughly 8-14".
- Segment 10 - The unit was deployed off of Tsienneto Road in a small clearing surrounded by shrubs and saplings, facing south toward a stand of eastern white pine trees. The area adjacent to these softwoods was shrubby and overgrown with lots of clutter, making deployment closer to these trees unsuitable. Snags were also present near the pines. Dominant species included quaking aspen, mostly 3" DBH or less, eastern white pine ( \(10-24^{\prime \prime}\) DBH), and red maple ( \(3^{\prime \prime}\) DBH or less).
- Segment 11 - The habitat along Segment 11 was primarily residential, which limited available locations for deployment. The unit was placed on town property near recreational fields along Tsienneto Road, facing west towards mature forest. The surrounding trees were a mix of hardwoods and softwoods, including White ash (dominant), quaking aspen, northern red oak, eastern white pine, and red maple. Average DBH was 3-10".
- Segment 12 - The detector was deployed along Tsienneto Road facing north over an emergent marsh/dry storm water retention pond. The surrounding forest was a mix of hardwood and softwood trees, with snags present throughout. The dominant tree species were red maple, followed by eastern white pine, American elm, northern red oak, white oak, ash, and black birch. The average DBH was 8-12".

\subsection*{3.3 Survey Results}

The number of calls recorded by species and location are presented in Table 3. Table 4 contains corresponding likelihood values. Blue cells are those with likelihood of presence values \(<0.05\) and correspond to species considered by Kaleidoscope Pro to be present. Bat calls were recorded at all Segments except for Segment 2. Calls from six species, big brown bat (Eptesicus fuscus), eastern red bat (Lasiurus borealis), hoary bat (Lasiurus cinereus), silver-haired bat (Lasionycteris noctivagans), little brown bat (Myotis lucifugus), and tricolored bat (Perimyotis subflavus) were recorded with p-values of less than 0.05 . Although Kaleidoscope Pro software identified four NLEB calls (one each at Segments 9 and 12, and both nights at Segment 7) the P-values for these calls are not below the required threshold to confirm this identification.

Table 3. Number of Calls by Date, Segement, and Species
\begin{tabular}{|c|c|c|c|c|c|c|c|c|c|}

\section*{Resumes}

\section*{SARAH A. BARNUM, CWB \({ }^{\circledR}\) Senior Wildlife Ecologist}

Dr. Barnum is a Senior Wildlife Ecologist at Normandeau with over 20 years of professional experience. Her background includes providing expertise to the transportation and energy sectors, as well as a variety of general development projects. She has hands-on experience with a wide range of species including forest birds, waterfowl, raptors, small mammals, large mammals, amphibians, and reptiles. Dr. Barnum's projects have emphasized examining habitat relationships, impact assessment for threatened and endangered species, mitigation planning, and Federal Endangered Species Act (ESA) compliance. Dr. Barnum also has extensive experience in project planning, project management, experimental design, and data analysis.

\section*{REPRESENTATIVE PROJECT EXPERIENCE}

\section*{Northeast Energy Direct Pipeline, Kinder Morgan, New} Hampshire, Massachusetts, Connecticut, New York (2015-
Present). Planning and coordination of surveys and reporting for state and federally listed wildlife to support state and federal permitting for installation of a new, 400 -mile long natural gas pipeline. Focal species include New England cottontail, songbirds, marsh birds, raptors, turtles, snakes, and lepidopterans. All tasks conducted to meet the Federal Energy Regulatory Commission (FERC) permitting requirements. Wildlife Task Manager.

\section*{Northern Pass Transmission Project, Eversource Energy,} Canadian Border to Deerfield, New Hampshire (2010-Present). Conducting wildlife assessments, impact analysis, and mitigation planning in support of state and federal permitting

\section*{EDUCATION}

Ph.D., Conservation Planning, University of Colorado
M.S., Wildlife Biology, Utah State University
B.S., (cum laude) Wildlife Biology, University of Vermont
PROFESSIONAL EXPERIENCE
2007-Present Normandeau Associates
2005-2007 New Hampshire Audubon
2004-2005 Baystate Environmental Consultants
2001-2003 Environmental Planning and Policy Unit, Colorado DOT
1998-2000 Office of Environmental Services, Colorado DOT
1996-1998 Dames \& Moore1993-1994 Bio-Resources, Inc.

\section*{PROFESSIONAL CERTIFICATIONS}
- Certified Wildlife Biologist
- AAE's Airport Wildlife Manager's Course and Wildlife Management Techniques Course
- Cyber Tracker Level III Tracking Certification

\section*{PROFESSIONAL AFFILIATIONS}
- The Wildlife Society
- New Hampshire Association of Natural Resource Scientists
- Epsom, NH Conservation Commission
- Bear-Paw Regional Greenways Land Conservation Committee for installation of a new, 200-mile long HVDC line in New Hampshire. Tasks include consultation with state and federal agencies (ESA, NEPA), desktop analysis, design and coordination of field surveys, writing the wildlife section of the SEC Natural Resources Report, and providing expert testimony. Focal species include Canada lynx, American marten, bats, raptors, song birds, turtles, snakes, and Karner blue butterfly. Wildlife Task Manager.

The Balsams Grand Resort, Dixville LLC, New Hampshire (2014 - Present). Planned and coordinated surveys and reporting for general wildlife issues and northern long-eared bat acoustic surveys. Wildlife Task Manager.

Boston Convention and Events Center Gull Dissuasion Study, Massachusetts Convention Center Authority, Boston, Massachusetts (2014-2016). Designed and oversaw field surveys of gull activities on

Environmental Consultants
the BCEC roof, and assisted in identification and evaluation of dissuasion strategies. Project Manager and Avian Biologist.

Post-Construction Mortality Monitoring, Pheasant Run Wind LLC, Huron County, Michigan (2014-2015). Conducted bird and bat post-construction fatality monitoring, coordinated data analysis and report writing. Project Manager.

Loon Pond Dam Reconstruction, Town of Lincoln, Lincoln, New Hampshire (2015-2016). Conducted habitat suitability assessment for Canada lynx and forest roosting bats for project located on Forest Service Land; coordinated rare plant surveys and wrote the Biological Evaluation. Project Manager and Wildlife Biologist.

Acoustic Northern Long-eared Bat Surveys, MassDOT, Massachusetts (2015). Planned and coordinated USFWS-compliant surveys and reporting for 20 separate MassDOT projects across MA. Project Manager.

Habitat Assessment and Acoustic Northern Long-eared Bat Surveys, Various, New Hampshire (2015). Planned and coordinated USFWS compliant surveys and reporting for four separate development projects in southern NH. Project Manager.

Northern Long-eared Bat Habitat Assessment, Horizons Engineering, Loudon, New Hampshire (2015). Conducted USFWS compliant habitat assessment and reporting for the proposed Liberty Pipeline. Project Manager and Bat Biologist

Fowler's Toad Study for Hydro Dam Relicensing, TransCanada, Connecticut River, New Hampshire and Vermont (2013-2014). Designed and conducted habitat suitability evaluation and toad survey; reporting. All tasks conducted to meet the FERC permitting requirements. Task Manager and Amphibian Biologist.

Loon Mountain Ski Area Expansion Biological Evaluation, US Forest Service, White Mountain National Forest, New Hampshire (2013-2014). Conducted habitat suitability assessment for Canada lynx, forest roosting bats, and black bear and wrote the Biological Evaluation. Wildlife Task Manager and Mammal Biologist.

New England Cottontail Permitting, Tidewater Landing, LLC, Wells, Maine (2013). Wrote the New England cottontail related permitting documents for the Tidewater Landing sub-division. Assessed habitat suitability and negotiated with MDIFW. Wrote the Habitat Management Plan and Incidental Take Plan required for the project permit. Project Manager and NEC Biologist.
Waterville Valley Ski Area Expansion Biological Evaluation, US Forest Service, White Mountain National Forest, New Hampshire (2012-2013). Conducted habitat suitability assessment for Canada lynx, forest roosting bats, and black bear, and wrote the Biological Evaluation. Wildlife Task Manager and Mammal Biologist.

Rare Species Surveys, Tennessee Gas Pipeline Co., various locations in Massachusetts and Connecticut (2012-2013). Rare species surveys in support of pipeline repair activities. Various surveys for rare turtles and rare plants prior to pipeline repair projects. Project Manager and Turtle Biologist.

Environmental Consultants
Winthrop Beach Piping Plover Management Plan, MA Department of Conservation and Recreation, Winthrop, Massachusetts (2012). Designed and wrote the piping plover management plan required as part of the permitting effort for the Winthrop Beach re-nourishment project. Project Manager and Avian Biologist.

Roseate Tern Expert Testimony, Entergy Nuclear Generation Company, Plymouth, Massachusetts (2012). Provided expert testimony summarizing potential impacts of relicensing of Pilgrim Nuclear Power Station in Plymouth, MA on roseate terns. Avian Biologist.

The Effect of Roadside Mowing Practices on Deer-Vehicle Collision Rates, Federal Highway Administration (2009-2012) Nationwide. Conducted literature review and interviews with State DOT personnel to summarize any known effects of roadside mowing regimes on DVC rates, followed by a quantitative analysis of DVC rates as a function of mowing regime. Project responsibilities include acquiring data from State DOTs, data management and analysis, and report writing. Data Analysis Task Manager.

Madaket Wind Permitting Assessment, Town of Nantucket, Nantucket, Massachusetts (20102011). Assessed avian and T\&E resources in the proposed project area to determine potential impacts and permitting requirements for 1-3 utility scale wind turbines on Nantucket DPW lands. Focal species included long-tailed duck, northern harrier, and night migrants (birds and bats). Work includes both desktop and field assessment. Project Manager, Wildlife Biologist.

Post-Construction Mortality Monitoring, First Wind, Stetson Wind Power Facility, Washington County, Maine (2010-2011). Managed personnel to search turbines for bird and bat fatalities, spring through fall and estimate fatality rates. Coordinated searcher efficiency trials and scavenger trials to estimate true number of fatalities; supervised and quality-checked fatality estimation and report writing. Project Manager.

Analysis of Methods to Identify Deer-Vehicle Collision Hotspot, Federal Highway Administration (2009-2011) Nationwide. Compared qualitative and quantitative methods to identify DVC hotspots, based on data needs, ease of implementation, expertise required, and relevancy to solving safety and ecological issues. Project responsibilities included review of methods through literature review and interviews with DOT staff, creating and implementing comparison protocols, staff management and report writing. Principle Investigator and Project Manager.

Brimfield Wind Avian and Bat Surveys, First Wind, Brimfield, Massachusetts (2009-2010). Avian and acoustic bat surveys to support environmental permitting for a proposed 20 MW project in southwestern MA. Avian surveys include raptor surveys and breeding bird surveys. Project Manager and Avian Biologist.

Avian Impact Assessment, Town of Saugus, Saugus, Massachusetts (2009-2010). Desktop analysis of biological and permitting issues associated with a proposed municipal, utility-scale wind development on the abandoned I-95 road bed Saugus, MA. Species of interest include neotropical migrants, wintering ducks, terns, and other shore birds. Project Manager and Avian Biologist.

Mitigation Wetland Functional Assessment, Federal Highway Administration, various nationwide locations (2008-2010). Wetlands constructed to mitigate for highway project-related

\section*{Environmental Consultants}
impacts and reference wetlands were surveyed, and levels of invasive cover and wildlife functions compared. Project responsibilities included interviewing state DOT staff to identify and select study sites, conducting surveys, semi-quantitative analysis, report writing, and managing staff. Project Manager.

Seabrook Nuclear Facility Relicensing, Florida Power and Light, Seabrook, New Hampshire (2008-2010). Reviewed and summarized all terrestrial ecology issues associates with facility construction and operations with a focus on threatened and endangered species, and impact assessment; results presented in a NRC compliant Environmental Report format to support relicensing. Task Manager.

Nine Mile Point Nuclear Facility Expansion, Constellation Energy, Scriba, New York (2007-2010). Wildlife studies to support expansion of an energy facility in Oswego NY. Tasks included field review of the site, evaluation of the habitat's ability to support potential threatened and endangered species, and impact assessment; results presented in a NRC compliant Environmental Report format to support licensing. Wildlife Task Manager.

Mount Snow Resort Snow Making Upgrade Biological Evaluation, US Forest Service, Green Mountain National Forest, Vermont (2008). Review all threatened and endangered species issues associated with a snow making upgrade; analyzed impacts and summarize results in a Forest Service Biological Assessment and a NEPA Environmental Assessment. Senior Wildlife Ecologist.

Casco Bay Fuel Line Removal, U.S. Navy, in Brunswick and Harpswell, Maine (2008). Wildlife studies to support Corps 404 and Maine NRPA permitting. Conducted habitat survey of project area, mapped wildlife habitat, and assessed impacts, with a focus suitable habitat for and presence of species listed by the State of Maine and /or USFWS. Compiled results in a report to support all local and federal permitting efforts. Senior Wildlife Ecologist.

Canada Lynx and American Marten Habitat Assessment, Mount Washington Resort, Bretton Woods, New Hampshire (2007-2008). Provided expert opinion regarding the suitability of the resort's property for Canada lynx and American marten. Tasks included field assessment of the property, review of current literature, producing a written report detailing analysis approach and findings, and ongoing consultation with regulating agencies. Senior Wildlife Ecologist.

NH Route 2 Wildlife Crossing Investigation, New Hampshire Audubon, Jefferson and Randolph, New Hampshire (2005-2007). Designed, implement and managed a tracking study to identify the locations where wildlife crossed the highway, and to determine the characteristics of preferred crossing locations. Tasks included extensive quantitative and qualitative analysis of GIS based data sets. Principle Investigator and Project Manager.

Runway Expansion Feasibility Study, Town of Montague Airport Commission, Montague, Massachusetts (2004-2005). Analyses of potential impacts to birds, sensitive habitats, and special status species including grasshopper sparrows, box turtles, rare plants, and pine-barrens associated insects present in the project area Tasks included field surveys, literature reviews, report writing and general project management. Project Manager.

Environmental Consultants
Runway Expansion Feasibility Study, Martha's Vineyard Airport Commission, West Tisbury, Massachusetts (2004-2005). Conducted analyses and mitigation planning for potential impacts to birds, sensitive habitats, and special status species, including grasshopper sparrows, rare plants, and pinebarrens associated insects. Tasks included consultations with the MA Natural heritage and Endangered Species Program, field surveys, impact assessments, mitigation planning, literature reviews, report writing and general project management. Project Manager.

Programmatic Section 7 Consultation Regarding Impacts to Canada Lynx, Colorado Department of Transportation (2001-2002). Researched and wrote the document that served as the basis for a programmatic agreement between the USFWS and CDOT. Tasks included analysis of habitat and highway conflicts, analysis of likely impacts to lynx resulting from highway projects, development of a formalized impact assessment procedure, and literature review. Environmental Planner.

US 40 Rabbit Ears Pass Upgrade, Colorado Department of Transportation, Grand and Jackson Counties, Colorado (2001). Assessed project area for wildlife corridors and use by Canada lynx and large ungulates. Worked with project engineers and USFS to develop design recommendations, including locations for potential under passes, to improve motorist safety, reduce wildlife mortality and provides habitat connectivity. Environmental Planner.

US 9 Upgrade, Colorado Department of Transportation, Silverthorne, Colorado (1999-2000). Assessed project area for wildlife corridors and use by Canada lynx and large ungulates. Developed recommendation to improve motorist safety, reduce wildlife mortality and provides habitat connectivity. Worked with project engineers and designers to design and locate two wildlife underpasses. Endangered Species Specialist.

US 40 Berthoud Pass Upgrade, Colorado Department of Transportation, Clear Creek and Grand Counties, Colorado (1997-1998). Habitat assessment at the local and landscape scale to determine the best locations for wildlife underpasses to benefit mule deer, elk, Canada lynx and other species. Coordinated with project planners and designers to design underpasses that were appropriate for the target species and that provided engineering feasibility. Endangered Species Specialist.

\section*{Biologist/Data Analyst}

Ms. O'Brien is a biologist with six years of professional experience in wildlife research, conservation, and natural resource management throughout New England. Her projects have emphasized protecting and managing threatened and endangered species, assessing environmental impacts, regulating and managing natural resources and wildlife, and ensuring Federal Endangered Species Act compliance. Her diverse wildlife background includes experience with forest, wetlands, and marsh birds, shorebirds, waterfowl, songbirds, raptors, amphibians, and small mammals, including bats. In addition to her field skills, Ms. O'Brien possesses a strong foundation in project planning and implementation, project management and organization, and data analysis and quality control.

Additionally, Ms. O'Brien is a SAS programmer in the Technical Data Processing group. In this capacity she is responsible for the integrity and quality of data and for the generation of final data deliverables.

\section*{REPRESENTATIVE PROJECT EXPERIENCE}

Balsams Ski Resort Expansion, Northern Long-eared Bat Surveys Dixville LLC, Dixville, NH (2015-Present). Dixville

\section*{EDUCATION}
M.S.E.S., Applied Ecology, Indiana University, Bloomington
M.P.A., Environmental Policy and Natural Resource Management, Indiana University, Bloomington
B.A., (cum laude) Biology, Saint Anselm College
PROFESSIONAL EXPERIENCE
2013-Present Normandeau Associates
2011-2013 U.S. Fish \& Wildlife Service, Umbagog National Wildlife Refuge
2012 Ducks Unlimited, Inc. U.S. Great Lakes Region

2009-2011 Office of Sustainability, Indiana University, Bloomington
2008 Dickinson College Biodiesel Shop

PROFESSIONAL AFFILIATIONS
- New Hampshire Audubon
- Loon Preservation Committee
- New Hampshire Association of Natural Resource Scientists LLC is proposing to revive and expand the deteriorated Balsams Grand Resort and Wilderness Ski Area into a year-round resort. The project includes restoring the original resort and facilities, constructing new facilities, and increasing the ski terrain from approximately 100 acres to 1200 acres. Normandeau was retained to undertake natural resources data collection efforts and to assist with environmental State and Federal permitting. Ms. O'Brien played a large role in the 2015 Northern long-eared bat surveys, where, in addition to deployment and retrieval of detectors, she coordinated site access and field crew schedules, and was responsible for data reporting, and habitat assessments. Biologist.

Pike Industries Northern Long-eared Bat Surveys, Hooksett, New Hampshire (2015). Normandeau is conducting Northern long-eared bat survey work for a proposed quarry expansion. Ms. O'Brien conducted the Northern long-eared bat surveys, which involved deployment and retrieval of acoustic detectors and habitat analysis of detector sites. Biologist.

\section*{Socha Companies Northern Long-eared Bat Surveys, Hooksett, New Hampshire (2015).}

Normandeau is providing delineation and natural resource survey work for a proposed apartment complex. Ms. O'Brien participated in Northern long-eared bat surveys, which involved the deployment and retrieval of acoustic detectors. Biologist.

Northern Pass Transmission Line Project Northern Long-eared Bat Surveys, Northeast Utilities, NH (2014-present). Northeast Utilities is proposing the Northern Pass Transmission Line, a 180-mile HVDC and AC Transmission project to bring hydropower from Quebec into New Hampshire and the New England region. Ms. O'Brien is involved with various aspects of this project, including wetland mitigation research and permit preparation for NH Department of Environmental Services Shorelands, Wetlands, and Alteration of Terrain Permits. Ms. O'Brien is also providing GPS support for delineated wetland boundaries, and participating in natural resource surveys including rare plants, vernal pools, and bats. Ms. O'Brien was especially involved with Northern Long-eared Bat surveys, where she managed scheduling for up to five people, conducted habitat analysis, deployed and retrieved detectors, and wrote code to filter call data for target species identification. Biologist.

Confidential Client, (2014-2015). This is a confidential energy project. Ms. O'Brien was involved with various aspects of this project, including wetlands and mitigation in a fatal flaw analysis, map revisions in ArcGIS for presentation at state and local meetings, wetland compensatory mitigation research and ARM fund numbers. Ms. O'Brien is also providing GPS support for delineated wetland boundaries, and participating in natural resource surveys including vernal pools, turtles, snakes, Northern Harriers, and bat hibernacula. Additionally, Ms. O'Brien helped with the creation of public outreach documents involving tourism in associated project areas. Biologist.

Bat Monitoring, U.S. Fish \& Wildlife Service, Umbagog National Wildlife Refuge, NH/ME (20112013). Ms. O'Brien evaluated resident bat populations adjacent to Lake Umbagog. Monitoring activities included conducting maternity roost emergence surveys and acoustic driving transect surveys. Coordinating volunteer efforts, completing required documentation following each survey, maintaining and preserving accurate records, and updating database records was also practiced. Biological Technician.

\section*{SPECIAL TRAINING}

Motor Boat Operator Certification (Department of the Interior), valid through 06/2016
Defensive Driving (Department of the Interior), valid through 06/2016
CPR/AED (American Red Cross), valid through 02/2017

Environmental Consultants

\section*{Stephen R. Lindsay Wildlife Biologist, Bat Specialist}

Stephen Lindsay is a wildlife biologist with special expertise in bats, raptors, grassland birds, and endangered species, particularly in the northeastern United States. His experience working with and studying bats includes mist netting, harp trapping, affixing transmitters and pit tags, banding and handling, performing hibernacula surveys, using acoustic monitoring devises, and analyzing acoustic results. He is also experienced in radio telemetry and GIS.

While working for the New York State Department of Environmental Conservation

\section*{EDUCATION}
B.S. 2011, Wildlife Management, Paul Smith's College
A.S 2007, Individual Studies

PROFESSIONAL EXPERIENCE
2015-Present Normandeau Associates
2013-2015 New York State Department of Environmental Conservation Vesper Environmental New Jersey Audubon Penn State University (NYSDEC), Stephen handled hundreds of bats, identifying them to species, assessing reproductive status, determining sex and age, and banding and attaching pit tags. He also monitored Indiana and northern long-eared bats, deploying acoustic devices and analyzing results to identify species using full spectrum programs.

\section*{SELECTED PROJECT EXPERIENCE}

Reassessing Summer Range of Indiana Bats (Myotis sodalis) in the Hudson Valley, New York, NYSDEC (2013-2015) - Assess previous summer range use of Indiana bats using previously collected data. Used GIS and areal mapping to determine detector location and gain access to private and public location for detector deployment. Deployed acoustic detectors at sites throughout the Hudson Valley to detect Indiana bats. Collected, sorted, and filter collected data. Ran data through call analysis software and verified that the species determinations were correct for Myotis species. Set and monitored triple high mist nets at high priority sites. Determined species, sex, and age of captured bats and attached radio transmitters to captured Indiana bats. Perform exit counts at discovered maternity colonies. Wildlife Technician.

Monitor Cave Ecosystems and White-Nose Fungus Presence in Bat Hibernacula, New York, NYSDEC (2013-2015) - Accessed known hibernacula of Indiana bats and determined the number present. Used caving gear, including caving suits and ropes/harnesses, to enter natural cave formations and abandoned mining sites. Took swabs from the ceiling of the cave at various locations using climbing and ladders. Took soil samples from the floor at various locations. Retrieved temperature and humidity monitoring buttons and collected data from them. Replaced and reported missing detectors. Wildlife Technician.

Bi-yearly Winter Survey of Indiana Bat (Myotis sodalis) Hibernacula, New York, NYSDEC (2013-2015) - Accessed known hibernacula of Indiana bats and determined the number present. Used caving gear, including caving suits and ropes/harnesses, to enter natural

Environmental Consultants
cave formations and abandoned mining sites. Navigated through complex tunnel systems and used caving maps. Photographed and visually counted the number of Indiana bats and other species present. Wildlife Technician.

Determining Range of Wintering Raptors Throughout the Hudson Valley, New York, NYSDEC (2013-2015) - Performed wintering raptor surveys in areas of the Hudson Valley known and suspected to be occupied to determine roost locations and sites used by wintering raptors. Used bi-weekly surveys to determine presence of winter raptors with special interest in Short-eared Owl (Asio flammeus) and Northern Harriers (Circus cyaneus). Used bow nets and live bait to lure and capture both species near roost locations. Handled, banded, collected biological data, and affixed tail-mount radio transmitters to captured birds. Performed radio telemetry on birds to determine roost locations and foraging data. Wildlife Technician.

Aeolas Cave Winter Mortality Survey, Vermont, Vesper Environmental (Summer 2014) Helped determine the survival rate of hibernating bats at Aeolas cave using pit tags and mark and capture. Deployed harp traps at cave mouth and nearby. Assessed species, age, sex, and reproductive status of captured bats. Affixed pit tags and wing bands. Bat Technician.

Assessment of Grassland Bird Nesting Success and Survival at PAX Naval Air Station, Maryland, New Jersey Audubon (Summer 2012) - Located and monitored grassland birds, with emphasis on eastern meadowlarks and grasshopper sparrows, on grassland plots at air bases to determine effects of mowing on productivity and survival. Performed nest searches using roping and sticking, nest monitoring, band resighting, nestling banding, and vegetation surveys. Maintained a professional working relationship with Patuxent Air Naval Station base officials. Field Technician.

\section*{Assessment of Grassland Bird Community response to Habitat Manipulation at} Reclaimed Strip Mine Mountains, Pennsylvania State University (Summer 2011) - Assisted with PhD research on grassland bird community response to habitat manipulation on reclaimed surface mine grasslands in west-central Pennsylvania. Assessedchanges in survival, apparent return rates, and population sizes for these areas following vegetation removal. Assisted with capturing (via playback) and banding adult and nestling Grasshopper, Henslows, Savannah, and Vesper Sparrows. Performed nest searches and monitoring, and re-sighted color-banded birds to estimate population sizes. Research Assistant.

\section*{SPECIAL TRAINING}
- Chemical Immobilization Training, Safe Capture International

\section*{Appendix N: Cultural Resources}

\title{
Cultural Resource Memorandum of Effect
}
(Municipally Managed Projects)
Project Name: Derry-Londonderry Exit 4A - Alternative A Date: June 7, 2007 State No.: 13065 Federal No.(as applicable): IM-93-1(201)12

Pursuant to meetings on_8/20/1998, 8/4/2005, 3/2/2006, 3/9/2006, 6/8/2006, 10/5/2006, \(4 / 5 / 2007\), and for the purpose of compliance with the regulations of the National Historic Preservation Act and the Advisory Council on Historic Preservation's Procedures for the Protection of Historic Properties (36 CFR 800), the NH Division of Historical Resources and, when applicable, the NH Division of the Federal Highway Administration or the US Army Corps of Engineers have coordinated on the identification and evaluation of cultural resources relative to providing transportation improvements, including construction of a new interchange with Interstate 93 (I-93) (known as Exit 4A), to address existing traffic congestion and safety issues on NH Route 102 and to promote economic vitality in the Derry/Londonderry area. The project extensively reviewed different alternatives through the preparation of an environmental impact statement (EIS).

Alternative A would construct a new interchange on I-93 located approximately one mile north of the existing Exit 4. The interchange would have north and southbound on- and off-ramps, with access only to the east. An access road would connect the interchange with Folsom Road. The Alternative would require land and building acquisitions along the north side of Folsom Road then continue along Tsienneto Road to its intersection with NH Route 102.

\section*{HISTORIC RESOURCES}

Along the corridor, two residential properties were determined to be eligible for the National Register of Historic Places (NRHP). These properties are located in Derry and identified as:
\begin{tabular}{|l|l|l|l|}
\multicolumn{1}{c}{ Number } & \multicolumn{1}{c}{ Address } & \multicolumn{1}{c}{ Description } & \multicolumn{1}{c|}{ Eligibility/Criteria } \\
\hline DER0134 & 76 Tsienneto Road & Palmer Homestead & Eligible (C) \\
\hline DER0135 & 72 Tsienneto Road & E.F. Adams House & Eligible (C) \\
\hline
\end{tabular}

It was determined that Alternative A would have no effect on these NRHP-eligible properties.

\section*{ARCHAEOLOGICAL RESOURCES}

There are no known archaeological sites that will be affected by Alternative A. However, there is one area of pre-contact Native American archaeological sensitivity along this Alternative corridor. This sensitive area is located across the eastern extent of Tsienneto Road, in the vicinity of Jeff Lane. The expected impacts on this potentially sensitive area associated with the roadway improvements could reach 0.7 acre. FHWA and NHDHR agree that the preliminary Phase I-A archaeological review and report preparation provided an acceptable level of data for determining potential impacts to archaeological resources and proceeding to a public hearing. However, additional studies and identification of mitigation will be required as the project progresses.

\section*{MITIGATION}

Historic Resources
As no historic resources will be effected by this Alternative, no mitigation is proposed.

\section*{Archaeological Resources}

Once an alternative has been chosen and the public hearing has been held, a Phase IB field verification and report preparation by a professional archaeologist will be completed for the Selected Alternative. Based on the findings in the Phase \(\operatorname{IB}\) report, additional, more intense field work may be required under a Phase II site survey.

A Phase II survey would be completed once the final design stage of the project has been reached. The Phase II work would include additional field investigation and research to help determine site integrity, establish a period of occupation, function, cultural affiliation, and associated context, and to more closely define site boundaries within the project area. Field examination would involve a combined strategy of excavation using 0.5 -meter by 0.5 -meter tests with 1 -meter by 1 -meter units and trenches, as well as mapping visible features. A report would be completed to help explain the site(s) and how it compares to similar sites in the region, if they exist.

Any resources found will be reviewed by NHDHR and FHWA to determine if they are eligible for the NRHP. If the resource is found to be eligible, the project's effect on the resource will be determined. If the project is found to adversely affect an eligible resource, then a determination will be made as to whether the resource should be preserved in-place or recovered.

If after reviewing the reports and data provided in the Phase II level study, and considering the footprint of the proposed design plans, it is determined by NHDHR and FHWA that recovery of a resource is required, then a Phase III data recovery plan will be implemented.

Although excavation of resources will need to be accomplished before construction of the project is complete, monitoring may be required during construction. Depending on the sensitivity of any findings, information or actual artifacts collected within the project area may be either displayed or presented to the public via numerous public outlets, such as museums, schools, informational brochures, internet websites, and other readily available and appropriate means.

Based on a review of the project, as presented on this date, it has been determined that:
图 No Historic or Archaeological Properties will be Effected
There will be No Adverse Effect on Historic or Archaeological Properties Describe any outstanding commitments: Not applicable.
\(\square\) There will be an Adverse Effect on Historic or Archaeological Properties or Resources Describe the effect, measures to minimize harm and proposed mitigation: Not applicable.

In accordance with the Advisory council's regulations, we will continue to consult, as appropriate, as this project proceeds.

\section*{Cultural Resource Memorandum of Effect}
(Municipally Managed Projects)
Project Name: Derry-Londonderry Exit 4A - Alternative B Date: June 7, 2007
State No.: 13065 Federal No.(as applicable): IM-93-1(201)12
Pursuant to meetings on 8/20/1998, 8/4/2005, 3/2/2006, 3/9/2006, 6/8/2006, 10/5/2006, 4/5/2007, and for the purpose of compliance with the regulations of the National Historic Preservation Act and the Advisory Council on Historic Preservation's Procedures for the Protection of Historic Properties (36 CFR 800), the NH Division of Historical Resources and, when applicable, the NH Division of the Federal Highway Administration or the US Army Corps of Engineers have coordinated on the identification and evaluation of cultural resources relative to providing transportation improvements, including construction of a new interchange with Interstate 93 (I-93) (known as Exit 4A), to address existing traffic congestion and safety issues on NH Route 102 and to promote economic vitality in the Derry/Londonderry area. The project extensively reviewed different alternatives through the preparation of an environmental impact statement (EIS).

Alternative B would construct a new interchange on I-93 located approximately one mile north of the existing Exit 4. The interchange would have north and southbound on- and off-ramps, with access only to the east. An access road would travel from the interchange cross country through the Derry Business Park located near A and B Streets, cross over NH Route 28 and connect with Ashleigh Drive. The Alternative would then continue traversing cross country, requiring land and building acquisitions along the north side of London Court, cross over NH Route 28 Bypass, acquiring several residences near Scenic Drive, then continue towards Tsienneto Road to its intersection with NH Route 102.

\section*{HISTORIC RESOURCES}

Along the Alternative B corridor, there are no National Register of Historic Places (NRHP)eligible properties. Therefore, it was determined that Alternative B would have no effect on any historic properties.

\section*{ARCHAEOLOGICAL RESOURCES}

Alternative B will affect no known archaeological sites. However, it could impact 1.2 acres of potentially sensitive pre-contact Native American sensitive area. This sensitive area is located across the eastern extent of Tsienneto Road, in the vicinity of Jeff Lane. FHWA and NHDHR agree that the preliminary Phase I-A archaeological review and report preparation provided an acceptable level of data for determining potential impacts to archaeological resources and proceeding to a public hearing. However, additional studies and identification of mitigation will be required as the project progresses.

\section*{MITIGATION}

Historic Resources
As no historic resources will be effected by this Alternative, no mitigation is proposed.

\title{
Cultural Resource Memorandum of Effect
}
(Municipally Managed Projects)
Project Name: Derry-Londonderry Exit 4A - Alternative C Date: June 7, 2007
State No.:_13065 Federal No.(as applicable):_IM-93-1(201)12
Pursuant to meetings on \(8 / 20 / 1998,8 / 4 / 2005,3 / 2 / 2006,3 / 9 / 2006,6 / 8 / 2006,10 / 5 / 2006\), 4/5/2007, and for the purpose of compliance with the regulations of the National Historic Preservation Act and the Advisory Council on Historic Preservation's Procedures for the Protection of Historic Properties (36 CFR 800), the NH Division of Historical Resources and, when applicable, the NH Division of the Federal Highway Administration or the US Army Corps of Engineers have coordinated on the identification and evaluation of cultural resources relative to providing transportation improvements, including construction of a new interchange with Interstate 93 (I-93) (known as Exit 4A), to address existing traffic congestion and safety issues on NH Route 102 and to promote economic vitality in the Derry/Londonderry area. The project extensively reviewed different alternatives through the preparation of an environmental impact statement (EIS).

Alternative C would construct a new interchange on I-93 located approximately one mile south of the existing Exit 5 . The interchange would have north and southbound on- and off-ramps, with access only to the east. An access road would travel from the interchange cross country to NH Route 28. The Alternative would continue south on NH Route 28 and connect with Ashleigh Drive. The Alternative would then traverse cross country, requiring land and building acquisitions along the north side of London Court, cross over NH Route 28 Bypass, acquiring several residences near Scenic Drive, then continue towards Tsienneto Road to its intersection with NH Route 102.

\section*{HISTORIC RESOURCES}

There is one National Register of Historic Places (NRHP)-eligible property located along the Alternative C corridor. This property is located in Londonderry and identified as:
\begin{tabular}{|l|l|l|l|}
\multicolumn{1}{c}{ Number } & \multicolumn{1}{c}{ Address } & \multicolumn{1}{c}{ Description } & \multicolumn{1}{c}{ Eligibility/Criteria } \\
\hline LON0114 & 79 Stonehenge Road & \begin{tabular}{l} 
Reed Paige Clark \\
Homestead
\end{tabular} & Eligible (A\&C) \\
\hline
\end{tabular}

It was determined that Alternative C would have an adverse effect on this NRHP-eligible property. There would be negative visual impacts on the farmstead complex and its historic rural agricultural setting. In addition, land takings would be required on the property to accommodate the proposed interchange.

\section*{ARCHAEOLOGICAL RESOURCES}

Alternative C will not affect any known archaeological resources. However, this alternative has the potential to impact two acres of pre-contact Native American sensitive areas in two separate locations. These locations include NH Route 28 at the Shields Brook crossing, and along Tsienneto Road in the vicinity of Jeff Lane. FHWA and NHDHR agree that the preliminary Phase I-A archaeological review and report preparation provided an acceptable level of data for determining potential impacts to archaeological resources and proceeding to a
public hearing. However, additional studies and identification of mitigation will be required as the project progresses.

\section*{MITIGATION}

\section*{Historic Resources}

Avoid using Alternative C and select one of the other alternatives that would not have impacts on the Reed Paige Clark Homestead.

\section*{Archaeological Resources}

Once an alternative has been chosen and the public hearing has been held, a Phase IB field verification and report preparation by a professional archaeologist will be completed for the Selected Alternative. Based on the findings in the Phase IB report, additional, more intense field work may be required under a Phase II site survey.

A Phase II survey would be completed once the final design stage of the project has been reached. The Phase II work would include additional field investigation and research to help determine site integrity, establish a period of occupation, function, cultural affiliation, and associated context, and to more closely define site boundaries within the project area. Field examination would involve a combined strategy of excavation using 0.5 -meter by 0.5 -meter tests with 1 -meter by 1 -meter units and trenches, as well as mapping visible features. A report would be completed to help explain the site(s) and how it compares to similar sites in the region, if they exist.

Any resources found will be reviewed by NHDHR and FHWA to determine if they are eligible for the NRHP. If the resource is found to be eligible, the project's effect on the resource will be determined. If the project is found to adversely affect an eligible resource, then a determination will be made as to whether the resource should be preserved in-place or recovered.

If after reviewing the reports and data provided in the Phase II level study, and considering the footprint of the proposed design plans, it is determined by NHDHR and FHWA that recovery of a resource is required, then a Phase III data recovery plan will be implemented.

Although excavation of resources will need to be accomplished before construction of the project is complete, monitoring may be required during construction. Depending on the sensitivity of any findings, information or actual artifacts collected within the project area may be either displayed or presented to the public via numerous public outlets, such as museums, schools, informational brochures, internet websites, and other readily available and appropriate means.

Based on a review of the project, as presented on this date, it has been determined that:
I No Historic or Archaeological Properties will be Effected
There will be No Adverse Effect on Historic or Archaeological Properties Describe any outstanding commitments: Not applicable.

\section*{There will be an Adverse Effect on Historic or Archaeological Properties or Resources Describe the effect, measures to minimize harm and proposed mitigation: See items listed above under Mitigation.}

In accordance with the Advisory council's regulations, we will continue to consult, as appropriate, as this project proceeds.

NH Division of Historical Resources

Project Manager
CC: FHWA, NHDHR, FHWA, ACOE ( \(\downarrow\) as applicable \(\uparrow\) )

\section*{Cultural Resource Memorandum of Effect}
(Municipally Managed Projects)
Project Name: Derry-Londonderry Exit 4A - Alternative D Date: June 7, 2007
State No.: 13065 Federal No.(as applicable):_IM-93-1(201)12
Pursuant to meetings on \(8 / 20 / 1998,8 / 4 / 2005,3 / 2 / 2006,3 / 9 / 2006,6 / 8 / 2006,10 / 5 / 2006\), 4/5/2007, and for the purpose of compliance with the regulations of the National Historic Preservation Act and the Advisory Council on Historic Preservation's Procedures for the Protection of Historic Properties (36 CFR 800), the NH Division of Historical Resources and, when applicable, the NH Division of the Federal Highway Administration or the US Army Corps of Engineers have coordinated on the identification and evaluation of cultural resources relative to providing transportation improvements, including construction of a new interchange with Interstate 93 (I-93) (known as Exit 4A), to address existing traffic congestion and safety issues on NH Route 102 and to promote economic vitality in the Derry/Londonderry area. The project extensively reviewed different alternatives through the preparation of an environmental impact statement (EIS).

Alternative D would construct a new interchange on I-93 located approximately one mile south of the existing Exit 5. The interchange would have north and southbound on- and off-ramps, with access only to the east. An access road would travel from the interchange cross country to NH Route 28. The Alternative would continue south on NH Route 28 and connect with Tsienneto Road. The Alternative would then continue along Tsienneto Road to its intersection with NH Route 102.

\section*{HISTORIC RESOURCES}

There are three National Register of Historic Places (NRHP)-eligible properties located along the Alternative D corridor. These properties are located in both Londonderry and Derry and identified as:
\begin{tabular}{|l|l|l|l|}
\multicolumn{1}{c}{ Number } & \multicolumn{1}{c}{ Address } & \multicolumn{1}{c}{ Description } & \multicolumn{1}{c|}{ Eligibility/Criteria } \\
\hline LON0114 & 79 Stonehenge Road & \begin{tabular}{l} 
Reed Paige Clark \\
Homestead
\end{tabular} & Eligible (A\&C) \\
\hline DER0134 & 76 Tsienneto Road & Palmer Homestead & Eligible (C) \\
\hline DER0135 & 72 Tsienneto Road & E.F. Adams House & Eligible (C) \\
\hline
\end{tabular}

Reed Paige Clark Homestead: It was determined that Alternative D would have an adverse effect on the Reed Paige Clark Homestead. There would be negative visual impacts on the farmstead complex and its historic rural agricultural setting. In addition, land takings would be required on the property to accommodate the proposed interchange.

Palmer Homestead: It was determined that Alternative D would have no effect on the Palmer Homestead.
E.F. Adams House: It was also determined that Alternative D would have no effect on the E.F. Adams House.

\section*{ARCHAEOLOGICAL RESOURCES}

Alternative D will not affect any known archaeological resources. However, this alternative has the potential to impact 1.5 acres of pre-contact Native American sensitive areas in two separate locations. These locations include NH Route 28 at the Shields Brook crossing, and along Tsienneto Road in the vicinity of Jeff Lane. FHWA and NHDHR agree that the preliminary Phase I-A archaeological review and report preparation provided an acceptable level of data for determining potential impacts to archaeological resources and proceeding to a public hearing. However, additional studies and identification of mitigation will be required as the project progresses.

\section*{MITIGATION}

Historic Resources
Avoid using Alternative D and select one of the other alternatives that would not have impacts on the Reed Paige Clark Homestead.

\section*{Archaeological Resources}

Once an alternative has been chosen and the public hearing has been held, a Phase IB field verification and report preparation by a professional archaeologist will be completed for the Selected Alternative. Based on the findings in the Phase IB report, additional, more intense field work may be required under a Phase II site survey.

A Phase II survey would be completed once the final design stage of the project has been reached. The Phase II work would include additional field investigation and research to help determine site integrity, establish a period of occupation, function, cultural affiliation, and associated context, and to more closely define site boundaries within the project area. Field examination would involve a combined strategy of excavation using 0.5 -meter by 0.5 -meter tests with 1 -meter by 1 -meter units and trenches, as well as mapping visible features. A report would be completed to help explain the site(s) and how it compares to similar sites in the region, if they exist.

Any resources found will be reviewed by NHDHR and FHWA to determine if they are eligible for the NRHP. If the resource is found to be eligible, the project's effect on the resource will be determined. If the project is found to adversely affect an eligible resource, then a determination will be made as to whether the resource should be preserved in-place or recovered.

If after reviewing the reports and data provided in the Phase II level study, and considering the footprint of the proposed design plans, it is determined by NHDHR and FHWA that recovery of a resource is required, then a Phase III data recovery plan will be implemented.

Although excavation of resources will need to be accomplished before construction of the project is complete, monitoring may be required during construction. Depending on the sensitivity of any findings, information or actual artifacts collected within the project area may be either displayed or presented to the public via numerous public outlets, such as museums, schools, informational brochures, internet websites, and other readily available and appropriate means.

Based on a review of the project, as presented on this date, it has been determined that:
I No Historic or Archaeological Properties will be Effected
- There will be No Adverse Effect on Historic or Archaeological Properties Describe any outstanding commitments: Not applicable.

图 There will be an Adverse Effect on Historic or Archaeological Properties or Resources Describe the effect, measures to minimize harm and proposed mitigation: See items listed above under Mitigation.

In accordance with the Advisory council's regulations, we will continue to consult, as appropriate, as this project proceeds.

\title{
Cultural Resource Memorandum of Effect
}
(Municipally Managed Projects)
Project Name: Derry-Londonderry Exit 4A - Alternative F Date: June 7, 2007
State No.: 13065 Federal No.(as applicable):_IM-93-1(201)12

Pursuant to meetings on_8/20/1998, 8/4/2005, 3/2/2006, 3/9/2006, 6/8/2006, 10/5/2006, 4/5/2007, and for the purpose of compliance with the regulations of the National Historic Preservation Act and the Advisory Council on Historic Preservation's Procedures for the Protection of Historic Properties (36 CFR 800), the NH Division of Historical Resources and, when applicable, the NH Division of the Federal Highway Administration or the US Army Corps of Engineers have coordinated on the identification and evaluation of cultural resources relative to providing transportation improvements, including construction of a new interchange with Interstate 93 (I-93) (known as Exit 4A), to address existing traffic congestion and safety issues on NH Route 102 and to promote economic vitality in the Derry/Londonderry area. The project extensively reviewed different alternatives through the preparation of an environmental impact statement (EIS).

Alternative F involves a minor upgrade of NH Route 102 between Londonderry Road and NH Route 28 Bypass to include a two-way center left-turn lane between Londonderry Road and NH Route 28, as well as sidewalk and roadway improvements between NH Route 28 and NH Route 28 Bypass. The entire corridor consists of roadway reconstruction (i.e., there is no portion on new alignment). This Alternative would require the removal of a majority of onstreet parking from the downtown area along NH Route 102.

\section*{HISTORIC RESOURCES}

There are three National Register of Historic Places (NRHP)-eligible districts and one individually-eligible property located along the Alternative F corridor. These properties are located in Derry and identified as:
\begin{tabular}{|l|l|l|l|}
\multicolumn{1}{c}{ Number } & \multicolumn{1}{c}{ Address } & \multicolumn{1}{c|}{ Description } & \multicolumn{1}{c|}{ Eligibility/Criteria } \\
\hline Area B & \begin{tabular}{l} 
NH Route 102/ \\
Broadway
\end{tabular} & \begin{tabular}{l} 
Broadway Historic \\
District
\end{tabular} & Eligible (A)* \\
\hline Area BI & Birch Street & \begin{tabular}{l} 
Birch Street \\
Historic District
\end{tabular} & Eligible (C)* \\
\hline Area DV & \begin{tabular}{l} 
NH Route 28 \\
Bypass, NH Route \\
102, and associated \\
side roads
\end{tabular} & \begin{tabular}{l} 
Derry Village \\
Historic District
\end{tabular} & Eligible (A) \\
\hline DER0102 & 116 East Broadway & \begin{tabular}{l} 
Gilbert and Helen \\
Hood House
\end{tabular} & Eligible (A\&B) \\
\hline
\end{tabular}
* This is a preliminary determination, if the districts were to be impacted, further investigations would be needed.

Broadway Historic District: It was determined that Alternative F would have an adverse effect on the Broadway Historic District. Intensifying east-west through traffic in the historic district could damage its historical and architectural character. It would disrupt its traditional
functions and values as a downtown business center, which requires convenient on-street shortterm parking, low traffic speeds and a pedestrian-friendly environment, to continue its role as a focal point for economic development and heritage tourism.

Derry Village Historic District: Alternative F was determined to have no adverse effect upon the Derry Village Historic District. Potential adverse effects have been mitigated by design through the planning process.

Birch Street Historic District: The Alternative was determined to have no adverse effect upon the Birch Street Historic District. Alternative F is unlikely to introduce more intense uses or heavier traffic into the district, nor to interfere significantly with its traditional functions and values as a pedestrian mixed use neighborhood in the town center.

Gilbert and Helen Hood House: It was also determined that Alternative F would have no effect on the Hood House.

\section*{ARCHAEOLOGICAL RESOURCES}

Alternative F will not affect any known archaeological resources. However, this alternative crosses an area of pre-contact Native American sensitivity along the south side of NH Route 102 between Hood Road and the limits of the corridor at the Derry Village traffic circle. It is estimated that a potential impact of 2.2 acres could occur to this sensitive area. FHWA and NHDHR agree that the preliminary Phase I-A archaeological review and report preparation provided an acceptable level of data for determining potential impacts to archaeological resources and proceeding to a public hearing. However, additional studies and identification of mitigation will be required as the project progresses.

\section*{MITIGATION}

\section*{Historic Resources}

Avoid using Alternative F and select one of the other alternatives that would not have impacts on historic properties.

\section*{Archaeological Resources}

Once an alternative has been chosen and the public hearing has been held, a Phase IB field verification and report preparation by a professional archaeologist will be completed for the Selected Alternative. Based on the findings in the Phase IB report, additional, more intense field work may be required under a Phase II site survey.

A Phase II survey would be completed once the final design stage of the project has been reached. The Phase II work would include additional field investigation and research to help determine site integrity, establish a period of occupation, function, cultural affiliation, and associated context, and to more closely define site boundaries within the project area. Field examination would involve a combined strategy of excavation using 0.5 -meter by 0.5 -meter tests with 1 -meter by 1 -meter units and trenches, as well as mapping visible features. A report would be completed to help explain the site(s) and how it compares to similar sites in the region, if they exist.

Any resources found will be reviewed by NHDHR and FHWA to determine if they are eligible for the NRHP. If the resource is found to be eligible, the project's effect on the resource will be determined. If the project is found to adversely affect an eligible resource, then a determination will be made as to whether the resource should be preserved in-place or recovered.

If after reviewing the reports and data provided in the Phase II level study, and considering the footprint of the proposed design plans, it is determined by NHDHR and FHWA that recovery of a resource is required, then a Phase III data recovery plan will be implemented.

Although excavation of resources will need to be accomplished before construction of the project is complete, monitoring may be required during construction. Depending on the sensitivity of any findings, information or actual artifacts collected within the project area may be either displayed or presented to the public via numerous public outlets, such as museums, schools, informational brochures, internet websites, and other readily available and appropriate means.

\section*{Based on a review of the project, as presented on this date, it has been determined that:}

\section*{No Historic or Archaeological Properties will be Effected}

There will be No Adverse Effect on Historic or Archaeological Properties
Describe any outstanding commitments: Not applicable.
图 There will be an Adverse Effect on Historic or Archaeological Properties or Resources Describe the effect, measures to minimize harm and proposed mitigation: See items listed above under Mitigation.

In accordance with the Advisory council's regulations, we will continue to consult, as appropriate, as this project proceeds.

\section*{Area Form}

\section*{17. Methods and Purpose (Continuation)}

The scope of work for this current phase of the project was specified at a joint meeting of FHWA, NHDOT and NHDHR on March 1, 2016.

This update was completed for the I-93 Exit 4A Interchange Study, Derry-Londonderry, NHDOT Project Number: 13065. The initial historic resources survey for the project took place from 19992002. Five alternative routes (see Project Map) were studied. Identification of Historic Resources included field survey of individual properties and historic districts that were done in 1999-2000. Products of that effort included 155 Individual Forms, one District Form, and a Derry Townwide Area Form. These were evaluated by the NHDHR DOE Committee in 2001 and 2002. These efforts focused on the areas potentially affected by all five alternatives. Note that no overall Project Area Form was prepared since the entire Project Area was included in, and therefore addressed fully by, the Townwide Area Form for Derry.

The project was put on hold from 2003 to 2005, after which the survey of historic properties needed to be updated to reflect current conditions. This effort was completed in 2005. The 2005 effort was intended to update the integrity and eligibility of all of the individuals and districts in Derry that had been determined eligible for the National Register in 2002 that were along the impact areas. All of these resources were field checked and assessed for integrity changes. The Derry Townwide Form was only updated relative to areas within the project area. The update to the Townwide Form was presented on Area continuation sheets and titled "Project Area Form" and included a table and updated photographs (Preservation Company 2005).
After the 2005 re-evaluation, NHDHR concluded that four of the 26 eligible properties in Derry were found to have changed to such a degree that they were no longer eligible for the National Register (see Table 1).
In 2006, Alternative A (see Project Map) was chosen as the preferred route. In 2007 a Draft EIS (DEIS) was submitted. The Final EIS (FEIS) was begun in 2009, and after funding delays the review process resumed in 2015. This necessitated yet another re-evaluation of the historic resources.

\section*{Current Work}

The 2016 survey update focused on the area of Alternative A, the Preferred Alternative. The Preferred Alternative impacts Madden Road, Folsom Road, Tsienneto Road, and the intersections of Manchester and Tsienneto Roads, North Main Street and Tsienneto Road, and Chester and Tsienneto Roads (see Project Map).

Preservation Company again reviewed the survey work done in 1999-2002 and 2005 in Derry to update and complete the Section 106 evaluation for Historic Resources and complete the FEIS. The individual resources and historic districts that were determined eligible in 2002 and 2005 were reviewed in 2016 with fieldwork and research to determine if any changes had been made to compromise eligibility.

Preservation Company conducted a windshield survey to assess these eligible properties, shown in Table 1, and noted any changes in integrity. Digital photographs were taken of all of the eligible properties, and a photographic record was created and presented on the appended photo pages (U01U30). The photographs are keyed to base maps provided by CLD Consulting Engineers.
Based on this work, NHDHR concluded that three properties in Derry (DER0036, DER0073, DER0083) were found to no longer retain sufficient integrity to meet the standards of eligibility for the National Register. For the Individual Survey Forms for these resources, black-and-white prints were made and attached to continuation sheets with scans of the 1999 or 2005 photographs provided
for comparison. A narrative re-assessment of the integrity and significance comparison was also given on the continuation sheets.
The current study of historic resources also required an evaluation of any previously unevaluated resources that had reached sufficient age to be considered for National Register eligibility (now 50 years or older, i.e., constructed between 1955 and 1968). The results of this effort are shown in Table 2. Seventeen properties in this area were found to now be of sufficient age to be considered for further study. Photographs were taken of these resources (D1-D23) and are keyed to a series of Photo Keys on base maps provided by CLD Consulting Engineers. A narrative updating the Derry Townwide Area Form (presented on Area Form continuation sheets) follows.
As per the scope outlined in a joint meeting between NHDOT and NHDHR in March 2016, attention was also given to the Wetland Mitigation Site (the "Caras Parcels" between Windham Road and Frost Road, see Caras Parcels Map) in Derry for any possible impact to historic resources. These parcels are surrounded by late twentieth century development along Berry Road to the north, Willow Street and Lilac Court to the west, Frost Street to the southeast, and Craven Terrace to the northeast. South Range Road to the east contains three parcels that were once part of a historic farm and still retain the outlines of some of the open areas that were once farmed. This land has been subdivided, and the earlier farmhouse is located at 7 South Range Road, whose parcel abuts the "Northern Caras Parcel." Historic stone walls that were used as historic property boundaries (no longer in use) can been seen in current satellite aerial photographs within the Caras Parcels.

\section*{Area Form}

\section*{19. Historical Background (Continuation)}

\section*{1950-present Highways, Commuting, Residential Development}

Residential development along Folsom Road and Tsienneto Road followed a general pattern of infill amongst earlier farmhouses and lightly populated intersections. The population growth of Derry following the construction of Interstate 93 in 1963 and the demand for housing increased dramatically as Derry became a "bedroom community" for Boston. This, along with the decline of farming in the area, led to the redevelopment of the rural farmland in this area.
Already lightly populated by the early twentieth century with a mix of farms and worker housing for nearby shoe factories, construction in the Hood's Pond area to the west of Crystal Avenue increased as neighborhoods were cut into former open land starting in the early twentieth century. "Franklin Terrace" was the name of a proposed development by Edmund M. Warren in the area bounded by Franklin Street, Folsom Road, and Crystal Avenue, and was laid out in a plan dated to 1908 (Rockingham County Registry of Deeds, Plan \#251). This proposed a dense development of approximately 156 lots and the construction of 6 streets in a grid parallel to Franklin Street. The first roads constructed were Exeter Street, Concord Avenue and Manchester Avenue, with Claremont Avenue and Laconia Avenue added in the 1950s. The lots were developed gradually over time from the 1920s through the 1980s.

The development of Barkland Acres, on the north side of Tsienneto Road, was proposed in 1965 (Plans \#546, 761, 689, and 744) and accepted by the town of Derry in 1966 (Deed 1836: 67). The designed subdivision initially consisted of approximately 170 lots and included the construction of Barkland Drive, Horseshoe Drive, Birchwood Drive, and Brookview Drive. By the early 1969, lots along Scenic Road had been laid out (Plan \#1537). The neighborhood developed quickly between 1965 and 1975, when most of the lots were purchased and new homes were constructed in similar sizes and styles.
Commercial development along Tsiennetto Road during the mid-twentieth century was tied to the creation of the Hood Shopping Plaza and several residential areas out of the former H.P. Hood Company farmland in the late 1960s. Previously mostly rural farmland and scattered residences, Tsienneto Road between the intersections of Manchester Road and Main Street saw gradual development in the second half of the twentieth century beginning with the construction of the Knapp Brothers shoe factory at the north corner of Manchester Road and Tsienneto Road (3 Manchester Road, photos 12, 13) in 1960, near the Klev-Bro Shoe company's new building at 22 Manchester Road constructed at the same time. Only a couple of years later, a car dealership was constructed on the southern corner of Tsienneto Road and North Main Street. By the 1970s an apartment complex to the north (Derry Country Club Estates) and the Hood Shopping Plaza commercial development to the south had been constructed; by the 1980s Sunview Condominiums had been developed next to Hood Plaza. By this time commercial development had fully encompassed the routes between Tsienneto Road and Derry Village: Crystal Avenue, Pinkerton Road, and North Main Street. The significant amount of development during this period reflects the more than tripling of the population of Derry from 1950 to 1980 (census.gov).

The area around Beaver Lake saw an increase in cabin and summer home construction during the mid-twentieth century, as well as a rise in year-round residency. The northwest corner of the lake, along Chester Road, small homes and cabins were placed on small parcels fitting in between and behind earlier lakefront properties. This area and others around the shoreline continue to be more densely developed through the early twenty-first century with the addition of more homes on subdivided parcels or new homes replacing older structures.

\section*{21. Architectural Description and Comparative Evaluation (Continuation)}

\section*{1950-present Ranches and Split Levels, Modern Commercial Development}

The area along Folsom Road west of Crystal Avenue and east of Franklin Street was where a dense development of farmland was proposed in 1908. However, the development was not all constructed at once, and lots were independently developed slowly over time, often on the combination of two or more of the small lots originally drawn in the 1908 plan, allowing for a variety of forms, density, and styles (photos 3,4, 8-11). Several houses were added on the north side of Folsom Road, independent of "Franklin Terrace," infilling open land near earlier houses. The houses in this area were generally modest homes constructed in contemporary vernacular styles, such as Ranch houses, Raised Ranches, and Cape-style homes (photos 2, 5-7).

The development of Barkland Acres, on the north side of the eastern end of Tsienneto Road, was proposed in 1965 and built out quickly in the following ten years. The neighborhood consists of mostly two-story houses with attached garages in styles and forms typical of this time period: Raised Ranches, Split Levels, and Garrisons, all on lots of approximately one-half to one acre in size. Roads cut for the development are slightly curved and take advantage of the natural topography, and most areas between the houses and lawns are naturally landscaped with trees and shrubs (photos 15-18).
Modern commercial development began in this area with the construction of two shoe factories on Manchester Road. Both constructed around 1960, they represent the more modern, low-rise industrial structures common in the mid-twentieth century and reflecting the downsizing of the shoe manufacturing industry. The former Knapp Brothers Shoe Corporation manufacturing building at 3 Manchester Road (photos 12,13) is now the home to a fire safety and control firm, but still retains the same general design and building footprint.
An early car dealership constructed ca. 1962 at the corner of Tsienneto and North Main Street (50 North Main Street, photo 14) was one of the earliest commercial additions to the area north of Derry Village along Tsienneto Road. Aerial photographs show a substantial expansion of the building ca. 1990 and the building was again fully renovated in the early 2000s.
Commercial and residential development continues along the main thoroughfares in Derry. Both major commercial construction and large housing developments have filled in all the former open farmland along Tsienneto Road. Large commercial development continues into the early 21st century especially along Manchester Road, near the town boundary with Londonderry, where a shopping mall, movie theater, and Wal-Mart have been recently constructed.

\section*{22. Statement of Significance (Continuation)}

No additions to the National Register of Historic Places have been made in Derry since the 2002 Area Form for Derry was completed.

The areas of Derry under consideration dating from 1958 to 1968 include residential subdivisions and planned neighborhoods, commercial development along main routes, and residential infill that is consistent with the trends of the growth of the suburbs in the mid-twentieth century. The residential area south of Folsom Road, "Franklin Terrace," is a vernacular neighborhood that evolved over a significant amount of time and is not cohesive enough of a development to be recommended for a district survey. However, Barkland Acres, the residential development on the north side of Tsienneto Road, was seemingly laid out with a particular design intent for the plan of the roads and lots, and the properties were developed in a condensed time period and share a fairly consistent style of house
and lot. Many of the homes may have been designed by the same architectural firm or firms, though more research is necessary. This is an area that might be surveyed as a potentially eligible district once the period of significance, likely 1965-1975, reaches the 50-year mark to be considered for the National Register.

The former shoe factory at 3 Manchester Road, constructed ca. 1960, seems to have retained integrity, though more research is necessary to confirm the original design. It was one of the last remaining shoe manufacturing companies in Derry, and is therefore potentially of historic interest at the local level. An individual survey is recommended for this property, as it may be eligible under Criterion A as having significance tied to the shoe manufacturing industry in Derry. It may also be eligible under Criterion C for architectural style.

\section*{24. Statement of Integrity (Continuation)}

Mid-twentieth century development in the areas along Folsom Road and Tsienneto Road has added to the loss of integrity in Derry as an overall historic community, as the resources added were part of infill and subdivisions covering old farm land and within earlier neighborhoods. The early and midtwentieth century designed developments in the area retain varying degrees of integrity, as many houses have been renovated over time and have synthetic exterior materials or additions and alterations to the original structure.

\section*{New Hampshire Division of Historical Resources}

\section*{Digital Photography Statement}

I, the undersigned, confirm that the photos in this inventory form have not been digitally manipulated and that they conform to the standards set forth in the NHDHR Photo Policy. My camera was set to the following specifications: "fine" image quality (compression ratio 1:4) and "large" image size ( \(3008 \times 2000\) pixels). These photos were printed using the following: Epson SureColor P600 photo printer on Epson Ultra Premium Photo Paper, glossy. The digital files are housed with Preservation Company in Kensington, NH.

Lynne Emerson Monroe, Preservation Company

\section*{Digital Photo Log}

The photography files for this project are named: Derry2016_D01-Derry2016_D23 and Derry2016_U01- Derry2016_U30 where the photos are numbers D01-D23 (Properties Dating 19581968) and U01-U30 (updates to Previously Determined Eligible Properties).

\section*{15. Location Map}

Location Map showing areas revisited for this update.
Street addresses of resources are listed in the Table on page A4.
Detail Maps/Photo Keys 1-4 begin on page A7.

\section*{17. Methods and Purpose (Continuation)}

The scope of work for this current phase of the project was specified at a joint meeting of FHWA, NHDOT and NHDHR on March 1, 2016. This update was completed for the I-93 Exit 4A Interchange Study, Derry-Londonderry, NHDOT Project Number: 13065. The objective is to review the work done in 1999-2002, and make it current to complete the Section 106 evaluation for Historic Resources. A Townwide Area Form for Londonderry was completed in 1995 for the Bedford-Manchester-Londonderry Project DPR-F-0047-(001), 11512. Six Individual Survey Forms were completed in 1999-2000 for this project (LON0094-LON0099). Survey was completed in 2001 for the I-93 Improvement Project: Salem-Manchester 10418c that included areas and individual properties that fall within the Exit 4A Project's Area of Potential Effects (as stated in the 2007 Draft Environmental Impact Statement, Section 3.8.4.2).

In August 2016, Preservation Company conducted a windshield survey of the project area to assess the changes to the properties that had retained eligibility as of 2002. The survey focused on the eligible properties in potential impact areas located on Rockingham Road, Stonehenge Road, and Pillsbury Road; this included the Woodmont Orchard Historic District. The Ash Street Bridge (Prowse Memorial Bridge) over Interstate 93 was also surveyed. Changes in integrity are noted in the following table. Of these resources, only one property ( 99 Rockingham Road) was found to no longer be individually eligible for the National Register. Continuation sheets were made for this property to be appended to form \#LON0103. They include current black-and-white prints with scans of the 2002 photographs provided for comparison as well as a narrative re-assessment of the integrity and significance comparison.

Digital photographs were taken of all of the eligible properties, and a photographic record was created for properties that were unchanged. This effort is presented on continuation sheets to the original Townwide Area Form and photographs are keyed to a base map taken from the Town of Londonderry MapGeo website (https://londonderrynh.mapgeo.io).
A table of eligible properties was prepared that shows the following information: Survey Number, Address, Map/parcel \#, Acreage, 2002 DOE, 2016 Integrity/Eligibility, Notes on Integrity, and 2016 photo number.

\section*{41. Historical Background and Role in the Town or City's Development}

The house at 11 Madden Road was constructed in 1955 behind the older Madden farmhouse that was demolished at about the same time. The 1892 Hurd Atlas shows "J. Madden" at this location, and USGS maps and historic aerial photographs show a house fronting Madden Road until at least 1952 (see below). James Madden (ca. 1819-1896), a farmer from Ireland, lived in the old house from 1854 on land that straddled the Derry/Londonderry border (Deed 359:356). The road known as Old Folsom Road had become Madden Road by the early twentieth century.
James Madden's son, William F. Madden (1871-1959), began to subdivide the Madden property in the 1950s. The first lot subdivided was his father's house on a lot of approximately two acres, which he sold to Nellie B. Kimball in 1952 (Deed 1241: 297). Two years later, in 1954, the Tinkham family purchased that lot (Deed 1331: 163). Wendell W. and Sylvia I. Tinkham were from Derry. Wendell was in the U.S. Navy during World War II. According to the current owner, Marcia Abbott, the Tinkhams demolished the old Madden farmhouse and constructed the smaller, 1-story house being surveyed.
In 1961, the Tinkhams sold the house to William E. and Kathleen L. Mahoney of Everett, MA (Deed 1602: 491). Their ownership was brief, as they sold it to Millard C. and Marcia E. Abbott in 1963 (Deed 1695: 86). Millard Abbott died in 1981, and Marcia Abbott is the current owner and resident.
This area of Derry lies between the tracks of the Manchester and Lawrence railroad and the Londonderry town line; it was remote farmland for much of the nineteenth and early twentieth centuries. A couple of small houses were constructed on the south side of the road in the mid-twentieth century. Development along North High Street and Folsom Road increased in the second half of the twentieth century, and by 2000 large areas of woods had been cleared for industrial warehouses located on the north and east sides of the house, though dense trees and vegetation help to screen Madden Road and maintain the earlier rural feel of the area.

\section*{42. Applicable NHDHR Historic Contexts (please list names from appendix C)}
131. Suburban/bedroom community growth in New Hampshire, c. 1850-present

\section*{43. Architectural Description and Comparative Evaluation}

The house at 11 Madden Road is a minimal Ranch style house with a cross-gabled roof, set back approximately 90 feet from the road. The house is clad in yellow vinyl siding, with brown asphalt shingles on the roof, and rests on a concrete foundation. The main entrance is in the front gable, set on the west side of the house, with a secondary entrance in a smaller wing addition on the west side. Adjacent to the main entry door is a row of five, six-light wooden casement windows. Elsewhere the house has \(1 / 1\) (on the façade) and \(2 / 2\) horizontal-light (on the rear) wooden double-hung windows covered with aluminum storm windows. Both doorways have modern, steel storm doors. A concrete block flue was added to the rear wall on the east end.

What trim detail might have existed originally has been thoroughly covered or removed by the addition of vinyl siding, likely installed in the 1990s. The eaves and fascia boards are squared and simple, and the doors and windows are framed with flat-stock trim. Simple window boxes are hung beneath the four double-hung windows to the east of the door on the façade. A pathway of modern brick pavers leads from the semicircular gravel driveway to the front door, and there is a concrete patio area in front of the secondary doorway on the west side of the front gable.

Two large silver maples, which were planted in the early 1960s, are sited at the front corners of the house. There are flower gardens in the front of the house, and a small vegetable garden to the west. There is a small wood, gabled storage shed (likely constructed at the same time as the house) northwest of the house and a modern, plastic shed to the east. The rear of the parcel is thickly wooded, and there are trees along the east edge of the property that provide a buffer from the surrounding industrial buildings.
This minimal Ranch is not typical or exemplary of the Ranch style and is not similar to any buildings in the immediate area. Derry experienced a period of major growth in the mid-twentieth century, and there are many other examples of buildings that better represent the Ranch style, such as the houses along Newell Drive and Kingsbury Road in Derry Village.

\section*{44. National or State Register Criteria Statement of Significance}

Criterion A: This property is not eligible under Criterion A because it is not associated with any event that has made a significant contribution to broad patterns in history. This house was constructed during a major building boom in Derry, but it is not part of a planned development or part of that trend in the mid-twentieth century.
Criterion B: This property is not associated with a historically significant person. It is the site of the farm of James Madden, an Irish immigrant who became a local farmer in Derry in 1854, but the buildings associated with his residency are gone. It is not eligible under Criterion B.

Criterion C: This house does not represent a distinctive type of architecture or work of a master. The Ranch house is a common house type in Derry, and this house neither exhibits a fully articulated expression of the Ranch style nor does it retain sufficient integrity to communicate its original design. Therefore it is not eligible for the National Register under Criterion C.

\section*{45. Period of Significance}

None

\section*{46. Statement of Integrity}

The property at 11 Madden Road retains its integrity of location and setting. However, the house has lost its integrity of design, materials, and workmanship due to the addition of vinyl siding, which covers any trim details that might have existed originally. The footprint of the building has not changed and there are some original windows. Even though development has encroached on the area in the north and east, the thick buffer of trees and vegetation maintains the character of the setting of the small house on a grassy lot with mature trees surrounded by woods.

\section*{47. Boundary Discussion}

The tax parcel (Map 31, lot 12) was used as the boundary of the area surveyed for this form. This property is not eligible for the National Register, so an eligible boundary discussion is not necessary.

\section*{41. Historical Background and Role in the Town or City's Development}

The house at 2 Ferland Drive was constructed in 1967 by a local builder, Roland Ferland, who subdivided and developed Ferland Drive.
Roland J. Ferland (1929-2004) and his wife, Pauline, moved to Derry from Sanford, Maine, in 1955 and purchased 97 North High Street (Deed 1353: 224, Photo 13). \({ }^{1}\) Ferland became a builder in the region, his company was called the Roland Ferland Construction Company. In the mid-twentieth century, Derry experienced a rapid rise in population, and Ferland took advantage of the associated building boom. His company built utilitarian homes, duplexes, and multifamily units primarily in Derry but also in Windham and Hudson (David J. Ferland interview, 2018). Research indicates that he was most active in the 1970's building primarily individual homes and duplexes or clusters of two or three as infill, rather than full neighborhoods. Although he was not a prominent builder, he served as president of the New Hampshire Home Builders Association in 1976 (Lambert Funeral Home Obituary 2004).
In 1962 Ferland purchased the three-acre lot adjoining his property at 97 North High Street and shortly thereafter filed plans for a road and four lots (Deed 1621: 302, Plan 852, see below). The subdivision plan includes the old house where he lived at 97 North High Street as Lot 1, lots 2 and 3 on Ferland Drive, and a fourth lot (not numbered) south of Lot 1. Over time, his family and business located on Ferland Drive.

In 1967-68 Ferland built houses at 1 Ferland Drive, (on the fourth, unnumbered lot, Photo 7) and 2 Ferland Drive (on Lot 2, Photos 1-6). The Ferland family, including three young children, moved into the new house at 1 Ferland Drive, and Roland Ferland's mother in law, Elise Barrieau, lived in 2 Ferland Drive. Roland and Pauline maintained ownership of this house until his daughter and son-in-law, Jacqueline and Paul Kramer, bought it in 1996 (Deed 3152: 1505; David J. Ferland interview, 2018). Eventually the family moved across the street into the larger house at 4 Ferland Drive (Photos 8, 9). In 1974, the lots further south on Ferland Drive were subdivided and developed (Plan 4523), creating 3 and 6 Ferland Drive (Photos 10, 11), which were constructed as apartment buildings. In 2004, the Kramers sold the house at 2 Ferland Drive to Ronald and Christine Randall, the current owners (Deed 4351: 2662). 5 Ferland Drive was constructed much later, in 2014, after the Ferland family had left the area (Photo 12).

In the late 1970s and early 1980s, Roland Ferland also purchased and developed lots nearby on Franklin Street, where there is now a row of multi-unit buildings named "Brookview Manor Court" (76-90 Franklin Street, 99 North High Street, see plan D-9948). These are split/bi-level buildings, a common type of the era seen throughout Derry and southern New Hampshire (Photos 14, 15). In 2001 Roland Ferland and his son, David, developed "Water View Estates" at 71 North High Street along Hood Pond (Plan 29779). Deeds indicate that Ferland had developed or renovated single or double lots in various other places in Derry, but most of his development was concentrated in the area near Ferland Drive. He built similar buildings in the nearby towns of Windham and Hudson (David J. Ferland interview, 2018).

\section*{42. Applicable NHDHR Historic Contexts (please list names from appendix C)}
131. Suburban/bedroom community growth in New Hampshire, c. 1850-present

\footnotetext{
\({ }^{1}\) The Ferlands lived at 97 North High Street for thirteen years. It is a \(11 / 2\) story sidehall, ca. 1888, that was surveyed in 1999 and found not eligible in 2002, DER0160.
}

\section*{43. Architectural Description and Comparative Evaluation}

The house at 2 Ferland Drive is a Ranch in the minimal Traditional style. It is sited facing west, with the façade on the long side facing Ferland Drive; the land drops to the rear allowing a full story facing Beaver Brook. The house rests on a poured concrete foundation and is clad in white vinyl siding with a gabled, asphalt shingle roof. Green vinyl shutters flank the windows on three elevations excepting the rear, and there is a wide brick chimney on the south end of the east, (rear) wall. There is a smaller wing enclosing a porch on the north elevation; with a low gabled roof that shares the western slope of the main roof. The eave line on the façade projects over the porch and bay window and recesses over the remaining bay.
The windows display a combination of vinyl double-hung windows (date unknown) on the first floor level and original \(2 / 2\) horizontal-light double-hung sash protected by storm windows on the rear, basement level. The façade has a central bay window with \(6 / 6\) windows supported by two brackets and a single \(6 / 6\) window to the south. The north elevation contains a large, vinyl picture window with simulated divided lights. There is single casement window on the rear, first floor level. The porch has a series of \(1 / 1\) storm windows on three sides.

The main entrance is through the enclosed porch on the north side, with a second door into the living space and another accessing a wood deck. The basement door on the rear elevation is located at ground level.
The paved driveway runs directly from the street to the face of the enclosed porch with a gravel parking area just to the north. A modern storage shed, added ca. 2010, is located to the north of the house, facing the gravel parking area.

\section*{Other Houses on Ferland Drive}

The other houses on Ferland Drive that were built by Roland Ferland are different types, forms, and styles. They are now all multi-unit residences, though 1 and 4 Ferland Drive were originally singlefamily houses.
- 1 Ferland Drive, built in 1967, (Photo 7) is a simple, Twentieth-century Cape with no Colonial Revival detail. It has vinyl siding and shutters and the eaves extend. The attached garage now has a basement apartment.
- 4 Ferland Drive, built in 1968 (Photos 8, 9) has the form of a ranch but with a cross-gable and integrated two-car garage but an above ground level under the rear pile. The gambrel roof of the cross-gable section on the north end extends to the ground, like a barn. The integral two-bay garage on the south end has applied cross-battens mimicking barn doors. It is sided with a combination of vertical wood siding and wood shingles. \({ }^{2}\) There are two driveway areas: an asphalt drive at street level connecting directly to the garage doors, and another concrete driveway on the south side that is sloped steeply to the lower ground level at the rear of the house, a full story in height. The concrete area extends to 6 Ferland Drive, and substantial concrete retaining walls were built to support the yards at each side. This wide drive was for the purpose of parking the trucks and machinery associated with Roland Ferland Construction Company.

\footnotetext{
\({ }^{2}\) According to Roland Ferland's son, 4 Ferland Drive was named the "Home of the Year", year unknown, by the Nashua Local Group of the NH Homebuilders Association. The NHHA didn't become a statewide organization until 1973 (Sharon Wayman interview, 2018). The unusual design was created by Roland Ferland (David J. Ferland interview, 2018).
}
- 3 and 6 Ferland Drive added after 1973 were constructed as apartment buildings. 6 Ferland Drive, built in 1974 (Photo 10), is a cross-gabled Ranch clad in green aluminum siding, white shutters and replacement windows. The driveways on each side slope to the above grade basement level, and there are concrete retaining walls lining the edges to support the front yard.
- 3 Ferland Drive (Photo 11) built in ca. 1975 combines a number of forms common to housing of the period: bi-level split-level ranch with a "wounded dove" shallow cross-gable, garrison overhang between the stories. It is clad in red aluminum siding with white shutters and replacement windows. Both 3 and 6 Ferland Drive are under ownership and management of Brookview Manor Court, Inc., which also owns the apartment buildings developed by Ferland at 76-90 Franklin Street.
- 5 Ferland Drive (Photo 12) is a two-story, two-family building with a lower garage level constructed in 2014. It sits on a large, irregular parcel that contains wetlands behind the apartment buildings along Franklin Street. There was previously a circular turnaround at the end of Ferland Drive on this lot as well as a mobile home or storage containers (see 2008 satellite photograph).

Ferland's development of apartment buildings along Franklin Street, Brookview Manor Court, is a series of split-level or two-story, multi-family buildings with brick lower and a vinyl-sided upper stories. Each has a central entrance in a shallow projection on the façade (Photos 14, 15).

\section*{44. National or State Register Criteria Statement of Significance}

2 Ferland Drive is not eligible for the National Register because it does not retain integrity necessary for eligibility status, nor does it individually meet any of the Criteria. Because it was constructed on a lot that was originally a family subdivision, the surrounding properties were also identified and considered as a possible district. However, the development of the Ferland land does not demonstrate a particular aspect of the historic context or theme for Derry, nor does the group as a whole represent a cohesive neighborhood that exemplifies local patterns or architectural distinction.
Criterion A: The house at 2 Ferland Drive was built by a local homebuilder and was one of the first houses he constructed as part of his own land development. This house was built for his family, not as part of his later subdivisions. He developed several lots in the immediate area between 1967 and 1975, and while they are of local interest, they are not collectively of sufficient age to interpret the trend in Derry. There are several more notable subdivisions and neighborhoods in Derry from this era that more clearly exemplify the post-World War II building boom. Therefore, 2 Ferland Drive is not eligible for the National Register under this Criterion as an example of this trend of home construction at the end of the twentieth century in Derry, New Hampshire.
Criterion B: The house at 2 Ferland Drive is not eligible under this Criterion as it is not associated with a historically significant person. Roland J. Ferland was a local homebuilder who developed a number of lots on the area between North High Street and Franklin Street. He also built a number of houses and multi-family dwellings in the region that are not significant architecturally. Although he served as president of the New Hampshire Home Builders Association for one year, his work is not distinctive as a whole.

Criterion C: The house at 2 Ferland Drive does not represent a distinctive style of architecture or work of a master. The Ranch form house is a common house type in Derry, and this
house neither exhibits a fully articulated expression of the Ranch style nor does it retain sufficient integrity to communicate its original design. Therefore, this property is not eligible for the National Register under Criterion C.

\section*{45. Period of Significance}

None

\section*{46. Statement of Integrity}

The house at 2 Ferland Drive retains integrity of location and setting. However, its integrity of materials and workmanship has been lost by the installation of vinyl siding, shutters, and replacement windows as well as the enclosure of the porch. Any original design details have been removed or covered, and only four original windows remain on the rear. The integrity of design remains in that the footprint and general massing of the building has not changed. The property retains integrity of feeling as it remains residential, but the association with the Ferlands is now gone as the property was sold out of the family in 2004.

\section*{47. Boundary Discussion}

The tax parcel (Map 31, lot 15) was used as the boundary of the area surveyed for this form (see Property Map). This property is not eligible for the National Register, so an eligible boundary discussion is not necessary.

\section*{41. Historical Background and Role in the Town or City's Development}

The house at 12 Folsom Road was constructed in 1964 on land that was developed by the Ross family. Eugene W. Ross (1860-1943) and his son, Bert E. Ross (1882-1957) moved to Derry from Cambridge, MA in 1907 to work in the dairy business. They had been employed by the H.P. Hood Dairy Co. in Boston, and moved to Derry, (the home of H.P. Hood), to start their own dairy business. In 1909 they rented (and purchased ten years later) the John Folsom farm at the corner of Folsom and Manchester Roads, and established the E.W. Ross \& Son dairy business, bottling and delivering milk (Holmes 2012).
The five-point intersection of Folsom Road, Manchester Road, Crystal Avenue, Tsienneto Road, and Pinkerton Street became known as Ross's Corner. The Ross family dairy business was very successful in the early twentieth century and was one of six commercial dairy farms in Derry. By the time Eugene Ross died in 1943, however, local dairy businesses were beginning to decline due to competition from larger regional and national companies (Holmes 2012). Bert died in 1957, and his son Herbert W. Ross (1911-1993) took on the family business, then known as Ross Corner Dairy.
Herbert took the land and farms that the family owned and subdivided part of the former Folsom farm field on the north side of Folsom Road. The first lot, now 16 Folsom Road, was sold to Earl and Viola Pelletier, Herbert's daughter, in 1962 (Deed 1637: 370). In 1963 Herbert's son, Donald W. Ross (1936-2015), purchased a subdivided lot on the western edge of the property (Deed 1669: 116, see Plan 1656). Donald and his wife, Joanne, had their house, 12 Folsom Road, constructed the following year. The house at 18 Folsom Road was the residence of Herbert Ross and his wife, Katherine and was constructed in 1970.

Herbert Ross attempted to streamline the operations of the dairy business, but it continued to decline. Ross Corner Dairy Company auctioned off the farm buildings, land, and operation equipment in 1970 (Nashua Telegraph, 18 June 1970). Reduced production continued with packaging by Turner Dairy in Salem. Products were still distributed at a warehouse on Folsom Road (Holmes 2012). Donald Ross took over the business in 1973 but could not keep up with commercial competition. Ross Corner Dairy went out of business in 1981.
The land formerly associated with the Ross dairy farm (and the Folsom farm before that) was fully subdivided and sold off in the 1970s and 1980s. The town of Derry owns the lot that once had the farm buildings on the northwest corner of Folsom and Manchester Roads (Map/lot 35/14-2), and the police station was constructed there in 1985. The car wash at 20 Folsom Road (Map/lot 35/14-5) was constructed in ca. 1975. The three Ross family houses along Folsom Road have sold out of the family. Herbert's house at 18 Folsom was sold in 1997 (Deed 3199: 891) after Herbert's death in 1993 and is now home to an office for the Salvation Army. 16 Folsom was sold by the Pelletier family in 2002 (Deed 3768: 2729) and has been renovated with the addition of a full second floor. 12 Folsom Road, the property being surveyed, was recently sold in 2015 following Donald Ross's death (Deed 5602: 1757).

\section*{42. Applicable NHDHR Historic Contexts (please list names from appendix C)}
56. Local-scale dairy farming, 1800-present
131. Suburban/bedroom community growth in New Hampshire, c. 1850-present

\section*{43. Architectural Description and Comparative Evaluation}

The house at 12 Folsom Road, constructed ca.1964, is a Raised Ranch with one and a half stories above grade and an integrated garage at the lower level. The lower level is constructed of brickfaced concrete block, while the upper level is clad in vinyl siding, installed in 2013. The lowpitched gable roof has asphalt shingles, and a wide exterior chimney is placed on the east end gable wall. The main entry door is centered on the façade at the upper level, reached by a flight of brick stairs with cast-concrete treads and black iron handrails. A secondary entry at the basement level is located just to the west of the brick stairs, and the single garage door is adjacent on the west side. The front door, as well as the overhead garage door, are original to the house. The lower-level entry door is a vinyl replacement with a fan light.

The windows were replaced with vinyl 6/6 replacement windows in 2013-2014 (see Google Streetview image below). Red vinyl shutters were added to the facade at the same time. The façade has a paired set of double-hung windows and a single double-hung window on the western half, and a bay picture window with paired double-hung windows below at ground level on the eastern half. The west elevation has two double-hung windows symmetrically placed with two awning windows below at the top of the concrete block basement wall. The rear, north elevation has a sliding glass door at the east end and two double-hung windows in the center of the elevation, with two awning windows at the lower level. The east elevation has no openings other than a small vent window just underneath the peak of the gable, same on the west elevation.
The house is sited approximately 40 feet from the road, with a row of four maple trees at the edge of the front yard. The wide, paved driveway is angled from the road to the garage door, with a gravel parking area off of it on the west side. A low, cast concrete block retaining wall edges the curve of the driveway on the east edge of the drive, leading to low brick steps and a taller brick-faced concrete block retaining wall attached to the house by the door at the lower level. A small flower garden bed is planted along the front of the house on the eastern half. The back yard has two large maple trees and an above-ground swimming pool.
Previous to the exterior renovations, the house had wide wood clapboards, original wood 6/6 doublehung windows, and white shutters. The front stairs had no handrails, and the lower-level door was a 9 -light wood door.

This house is fairly typical of Ranch style homes built in the mid-twentieth century in the area, but it is not a distinctive example and has lost integrity of original materials. Derry experienced a period of major growth in the mid-twentieth century, and there are many other examples of buildings that better represent the Ranch style, such as the houses along Newell Drive and Kingsbury Road in Derry Village.

\section*{44. National or State Register Criteria Statement of Significance}

Criterion A: This house was constructed during a major building boom in postwar Derry, but it is not part of a planned development, nor does it singularly represent a significant aspect of the broad pattern of history in Derry or the greater region. There are many other developments in the town of Derry that more are more representative of population growth starting in the mid-twentieth century. Therefore, it is not eligible under Criterion A.

Criterion B: This property is associated with the Ross family, which owned and operated a successful dairy operation at nearby Ross's Corner. It was built by Donald Ross, a

New Hampshire Division of Historical Resources
last update 06.20.2015
Individual Inventory Form
great-grandson, who was head of family dairy business in its final days. His significance to the family business does not rise to a level to grant individual eligibility to this house for its association with him.

Criterion C: This house does not represent a distinctive type of architecture or work of a master. The Raised Ranch house is a common house type in Derry, and this house neither exhibits a fully articulated expression of the Ranch style nor does it retain sufficient integrity to be eligible for the National Register under Criterion C.

\section*{45. Period of Significance}

None

\section*{46. Statement of Integrity}

This property retains integrity of location and setting, as it has not been moved and the setting of Folsom Road and the surrounding neighborhood has not substantially changed since 1964. However, the house has lost integrity of workmanship and materials with the loss of the original wide-lap clapboard and its replacement with narrow vinyl siding and trim boards, as well as the loss of original windows and their replacement with vinyl windows. Because of this, it has diminished integrity of design, though there have been no major additions or changes to the form of the house itself or the property. The property retains integrity of feeling as a residence, but its association has been diminished as it and the neighboring properties have been sold out of the family.

\section*{47. Boundary Discussion}

The tax parcel (Map 35, lot 12) was used as the boundary of the area surveyed for this form. This property is not eligible for the National Register, so an eligible boundary discussion is not necessary.

\section*{41. Historical Background and Role in the Town or City's Development}

3 Manchester Road was built in 1960 by the Derry Realty Corporation on land they had acquired the previous year (Deed 1959; Nashua Telegraph 5 May 1960). The new building with a "clean modernistic appearance" was constructed as a new shoe factory that would be occupied by the Knapp Brothers Shoe Manufacturing Corporation, manufacturers and sellers of men's shoes. The building consisted of a one-story front office wing roughly centered on a large rectangular manufacturing section, all erected using tilt-up construction. The building remained in use as a shoe factory until 1983, under several different entities, who continued to manufacture Knapp shoes. In 1983 the building was acquired by the Electronics Corporation of America (ECA), a Cambridge, Massachusetts, manufacturers of products that managed power systems in an industrial setting (Deed 1983; Cambridge Historical Commission). In 1988 Fireye Inc., originally a part of ECA, and a manufacturer of flame safeguard controls and burner management systems, acquired the property and continues to occupy it largely as first designed with office and manufacturing uses (Deed 1988).
Derry, New Hampshire, had a long association of shoe manufacturing, dating back to the midnineteenth century when the railroad came through the town. Shoe manufacturing remained a major part of the local economy into the 1980s though the method of manufacture changed significantly over that period. In the second half of the nineteenth century shoe manufacturing transitioned from predominantly outwork from factories (in nearby Massachusetts cities in the case of Derry), with much of the work done by Derry residents in their homes throughout the village. By 1850 the town had a large number of small shoe shops, with twenty-nine employing just one man. By the end of the nineteenth century, shoe manufacturing was centralized in large manufacturing facilities with steam power. In Derry, several shoe factories were erected or existing buildings were converted to that use. Several more were erected in the first quarter of the twentieth century, during the height of Derry's shoe industry. They were occupied by a series of companies whose financial successes appear to have been short lived (Preservation Company 2002, 36). As of 1915, however, the five big shops employed a total of 1,800 people, making more than 20,000 pairs of shoes a day (Preservation Company 2002, 37; Hazlett 1915, 283). The shoe industry in Derry recovered partially in the post-World War II period, but was limited due to competition from southern mills that had access to cheaper labor and power (Preservation Company 2002, 43).

In 1959, the Derry Realty Corporation acquired a parcel on Route 28 at what was then known as Ross’ Corner, upon which they erected the new office and manufacturing facility that would be occupied by the Knapp Brothers Shoe Manufacturing Company. \({ }^{1}\) The Bridgeport, Connecticut, architectural firm Fletcher-Thompson, Inc. designed the building. William C. Pahl Construction Company of Syracuse, New York, was the builder (Nashua Telegraph 5 May 1960). A 1960 Nashua Telegraph article indicated the building would be of "a clean modernistic appearance." Shoe making machinery was to be installed beginning in September 1960 with manufacturing to begin the following month (Nashua Telegraph 5 May 1960).
The Knapp Brothers Shoe Manufacturing Corporation had been established in Brockton, Massachusetts, by two Knapp brothers, Clarence E. (ca. 1892-1972) and Elwin D. (died 1969). Clarence E. had founded a shoe business in 1920 in the Pacific Northwest, with the then novel idea of selling directly to the consumer. In 1939, he and his brother moved east to establish a shoe manufacturing company, the Knapp Brothers Shoe Manufacturing Company. In the initial years, they occupied a former factory in Brockton, Massachusetts. During World War II they acquired the Barker

\footnotetext{
\({ }^{1}\) The Realty Company had acquired the land from Herbert W. Ross at which time the land included a barn where he housed his cattle, likely dairy cows (Deed 1959).
}

Shoe Company of Lewiston, Maine, and also operated a large factory there, manufacturing civilian and military shoes. They subsequently added the Derry factory and an additional one in Brockton (Boston Globe 4 October 1972). According to Clarence E. Knapp's obituary, the company became one of the ten largest shoe manufacturers and largest direct shoe sales companies in the world (Boston Globe 4 October 1972). \({ }^{2}\) In Derry it remained an important employer through the 1970s.
In 1970, two shoe manufacturing businesses owned by New York University (Knapp Brothers Shoe Manufacturing Corp. of Brockton and the King-Size Co.) were sold to a management group which established a new corporation, known as Knapp King-Size Corp. As of 1970, Knapp was the "world’s largest direct selling shoe firm." It distributed its shoes through 12,000 salesmen and thirty-eight retail shoe stores. It was a major manufacturer of safety footwear of industrial locations. King-Size, a major mail-order firm, specialized in footwear and apparel for tall and big men (Boston Globe 6 June 1970). It remained in operation in Derry at the Manchester Road facility until the end of 1981 (www.upi.com/Archives/1981/12/01/The-Derry-Shoe-Co-will-gradually-shut-down-this/ 4339376030800/).
The construction of the Knapp facility coincided with the construction of at least one other new factory, just to the northwest, the new Klev-Bro Shoe Factory (built ca. 1958) also on Manchester Road. Like the Knapp factory, that facility closed in the 1980s, essentially ending the long history of shoe manufacturing in Derry. But in the case of the Knapp factory, a new type of business moved into the building, one that became a part of the local economy but on a much smaller scale than shoe manufacturing.
Since 1983 the building has been the site of the manufacture of burner management systems. In that year, Electronics Corporation of American (ECA) acquired the property. The company, which originated in Waltham, Massachusetts, subsequently established new research headquarters in Cambridge, Massachusetts, in 1955 where they remained for many years. As of 1986, Electronics Corp of America was the third largest local employer in Derry with 110 employees (Preservation Company 2002). In 1991, the property was sold to a new entity, Fireye Inc. (originally a part of ECA) and they continue to manufacture the same type of burner management system products that had been produced in the building since its acquisition by ECA. Since that time some alterations have been made to the northeast end of the manufacturing space, most notably the enclosure of four loading bays/garages and the addition of an employee's entrance. Other electronics manufacturing facilities in Derry in this period included Hadco Printed Circuit (built 1969, demolished early 2000s), on the property just north of 3 Manchester Road.

Fletcher-Thompson, Inc. of Bridgeport, Connecticut, the architectural firm that designed the building, was established in 1907 by E. Leslie Fletcher. Two years later, Charles L. Thompson joined the practice and in early 1910 it was incorporated as the Fletcher Thompson Engineering Company, changing its name to Fletcher Thompson Inc. four years later. For many decades the practice specialized in industrial engineering. Beginning in 1916 two generations of the Phelan family played instrumental roles in guiding the expansion of the firm, up to the present day, that also included the acquisition of several other firms. The firm has increased its breadth of services for a range of mostly large private and public clients such as major commercial developers, colleges and universities, healthcare institutions, leading corporations, and local, county, and state governments.

\footnotetext{
\({ }^{2}\) The brothers had actually sold the company to New York University in the late 1940s though they had a ten-year employment contract as part of the sale and remained secured creditors. The ownership transfer was intended to benefit New York University ("Knapp Brothers Shoe Mfg. Corp. v. United States," Case No. 321-52, United States Court of Claims, 12 July 1956 (www.leagle.com/decision/19561041142fsupp8991873).
}
(www.fletcherthompson.com/about_history.aspx). Engineering remains an important component of their design work. They are known to have used tilt-up construction in other buildings contemporary with 3 Manchester Road, such as a 50,000 square-foot plant in Glens Falls, New York, for the Union Bag-Camp Paper Corporation in 1958-1959 and a warehouse addition in Montville, Connecticut, in 1961 (New York Times 15 September 1958; 5 February 1961).
The William C. Pahl Construction Company of Syracuse, New York, is known mostly for their large concrete construction projects in western New York. Other known work contemporary with 3 Manchester Road includes the Imperial Gardens Apartments in Syracuse (a twelve-story high-rise apartment building, built 1960), and Sadler Hall at Syracuse University (a brick-faced multistory student housing with dining hall, completed 1960).

\section*{42. Applicable NHDHR Historic Contexts (please list names from appendix C)}

Mid-twentieth-century shoe manufacturing
Late twentieth-century electronics manufacturing

\section*{43. Architectural Description and Comparative Evaluation}

3 Manchester Road is a large, rectangular, one-story building located on a flat 8.97-acre parcel. The flat-roofed building consists of two parts, the front office section and a larger, higher height manufacturing section to the rear (Photos 1-3). The six-bay office section is the more decorative of the two sections and includes four bays with curtain walls, a bay with the modified glass entry screened by an original concrete canopy, and a multi-colored masonry-faced bay with the name of the company. The masonry continues along the easterly elevation of the office section to either side of some additional curtain wall sections.

The construction method of multiple tilt-up concrete panels separated by concrete piers is particularly evident on the large industrial space to the northwest of the office section (Photos 5-7). Pedestrian and loading openings are in scattered locations on the southwesterly and northwesterly elevations and include a raised delivery doorway, large ground level garage door, and pedestrian doors including one accessed by concrete steps. The greatest number of alterations have occurred on the northeast elevation. At present an added pedestrian entrance is located in the second bay, providing access to the employee parking lot (Photo 1). The double-leaf metal doors are screened by a metal canopy. Historically this elevation included loading dock/garage door openings in four of the five bays. Evidence of them can be seen on the panels. The exterior of all the concrete panels is now covered with a painted cementitious material.

The building is notable for its tilt-up construction, a method that consists of large pre-cast concrete wall sections. The wall components were cast on site and then lifted into place with a crane. After placement of the walls they were then braced and tied in with the roof structure (www.tiltup.org/construction).
Though this building method was first "conceptualized" in the early 1900s, its use did not become common place until the development of the mobile crane in the late 1940s (Concrete Contractor).

Since that time the method has seen some innovations and refinements and remains in use for a variety of building types (Concrete Contractor; www.tilt-up.org/construction). \({ }^{3}\)
On the interior, the office space has been updated with the addition of new three-quarter height cubicle walls and drop ceilings with integrated overhead lighting. \({ }^{4}\) Original features include the regularly spaced piers and banks of full-height interior glass windows along the wall of individual offices that span the northwesterly wall of the office space (Photo 8). The large, open manufacturing space has been updated with new lighting and flooring but retains its historic interior steel framing comprised of posts, I-beams supporting the roof, in addition to exposed piping (Photo 9).
A possibly original square masonry signage base is located just south of the southerly corner of the building (Photo 4). Modern signage sits atop it with the name of the company. It is located within a landscaped, slightly elevated piece of ground that includes some mature shrubs and a smaller shade tree. Additional landscaping along much of the front side of the building includes large expanses of lawn and some mature shrubs and conifers. The other three sides of the building are flanked by asphalt paving used for parking and access to the loading and garage bays. Beyond the paved areas to the northwest and northeast are areas of a mix of shrubs and trees with some cut grass in places.
The property is located on the northeast corner of Tsienneto and Manchester roads, a heavily trafficked intersection. In the vicinity is a mix of commercial and small-scale industrial development, mostly dating to the last quarter of the twentieth century, along with a variety attached multifamily housing of the same period.

\section*{Comparative Evaluation}

The most direct comparable in Derry is the former Klev-Bro shoe factory built just before the Knapp factory, located just to the northwest at 22 Manchester Road (see comparable photograph on page 17). Like the Knapp factory, this modern, low-rise building is one story with office space on the front (though not nearly centered but rather located towards the southerly end) and the former manufacturing space to the rear. Though the building is no longer in manufacturing use as it has been subdivided for occupancy by multiple small business it retains its historic footprint, exterior materials, and much of its historic fenestration that distinguishes the two sections: large window openings for the former industrial space and regular three-part windows on the office section.

\section*{44. National or State Register Criteria Statement of Significance}

The Knapp Brothers Shoe Factory, 3 Manchester Road (constructed 1960), is eligible for listing in the National Register of Historic Places under Criterion A for its associations with shoe manufacturing in Derry and under Criterion C for its Architecture.

Criterion A: The Knapp Brothers Shoe Factory, 3 Manchester Road (constructed 1960), is eligible for listing in the National Register of Historic Places under Criterion A for its associations with shoe manufacturing in Derry. Its construction in 1960 represents the final stage of shoe manufacturing in Derry and its importance in the local economy. Shoe manufacturing in Derry dates to at least the mid-nineteenth century and it evolved over time as the manufacture moved from small one-person shops or outwork in people's

\footnotetext{
\({ }^{3}\) Well-known early examples are the houses constructed by Thomas Edison in 1908 in the newly created village of Union, New Jersey (Concrete Contractor).
\({ }^{4}\) According to the Assessor Records, the industrial area totals approximately 57, 630 square feet while the office area totals nearly 9,000 square feet.
}
homes to large factories powered by steam and/or water. 3 Manchester Road illustrates the final phase, incorporating manufacturing and office space within a single building as the company not only manufactured shoes but also sold the shoes directly to customers. The facility is representative of the scale and method of shoe manufacturing in New England in the mid-twentieth century.
Though not of sufficient age at this time for its association with electronics manufacturing once it becomes of sufficient age, that association would likely contribute to its significance as that became an important component of the local economy in Derry beginning in the 1980s, though at a considerably small scale. The property remains in use for manufacturing purposes with associated office space up to the present. Its transition to an electronics manufacturing space is representative of changes in the local economy beginning in the late twentieth century.
Criterion B: The Knapp Brothers Shoe Factory, 3 Manchester Road (constructed 1960), is not eligible for listing in the National Register of Historic Places under this criterion as it does not convey associations with individual persons that make it eligible under this criterion.
Criterion C: The Knapp Brothers Shoe Factory, 3 Manchester Road (constructed 1960), is eligible for listing in the National Register of Historic Places under Criterion C for its Architecture as a representative example of a mid-twentieth century manufacturing and office building in the modernist style that employs tilt-up construction, a common construction method of the period for industrial buildings. Stylistically, the building embodies a number of characteristic modernistic elements particular on the office section such as a low profile and contrasting building materials such as the curtain walls and masonry facing.
The building also embodies a distinctive method of construction, tilt-up construction. Though developed in the early twentieth-century, this construction method was first popularized in the post-war period with the development of mobile cranes. This method entails casting large concrete panels on site that are then lifted into place on the existing foundation and tied in with the roof framing and other structural members. This method of construction remains readily visible on the exterior and interior of the building.

\section*{45. Period of Significance}

1960-1968: The Period of Significance under Criterion A extends from the building's construction in 1960 to the fifty-year cutoff date for eligibility. The building was in continuous use as a shoe factory until 1983 and since that time has remained in continuous industrial and office use up to the present time.
1960: The Period of Significance under Criterion C is 1960 for its construction method and design.

\section*{46. Statement of Integrity}

3 Manchester Road retains integrity of design, materials, and workmanship. With the exception of the northeast elevation where the loading/garage bays were enclosed ca. 2000, the fenestration pattern, including the curtain wall windows on the office section is otherwise intact, as is the historic footprint. The main entrance appears to have been modified but this does not significantly alter the integrity of design and materials. The original tilt-up construction method is readily apparent and intact on the
manufacturing section. The building retains integrity of feeling and association as a mid-twentiethcentury manufacturing space with attached office space. The building retains integrity of location. The immediate setting of the building of the building has evolved considerably since its initial construction but this does not diminish the building's significance. At the time of its completion in 1960 only one other similar industrial and office building was present, located to the northwest on Manchester Road (see comparable). Otherwise the setting was rural, with a few scattered farmsteads. Though the Hoods Commons was developed on the former Hood Dairy Farm on the just southeast of 3 Manchester Road in 1969, the most extensive amount of commercial, residential, and small-scale industrial occurred by 1974 and 1992.

\section*{47. Boundary Discussion}

\section*{Part A}

The boundary of the area surveyed for this form was the tax parcel Map 8, Lot 269 as shown on the map below (dashed line).

Part B
The property's eligible boundary would include the entire tax parcel as it is the remaining portion of the original approximately 9.38 -acre parcel acquired by the Derry Realty Corporation in 1959 and developed with the current building, occupied initially by the Knapp Brothers Shoe Manufacturing Corporation. The entire parcel contributes to the property's significance as a shoe factory and office. A small portion of the original parcel was acquired by the NHDOT in 1982 in connection with road expansion along the easterly side of NH Route 28 and northerly side of Tsienneto (Plan of Derry MG-M-5119(001)-C-2422-A on file with NH Dept of Public Works and Highways).

\section*{41. Historical Background and Role in the Town or City's Development}

Jake's Auto Body ( 80 Chester Road), is located in central Derry on the west side of Chester Road (NH Route 102) just west of Beaver Lake. A small part of the existing building was constructed ca. 1961 by Jacob (Jake) DeGroot Sr. (1919-2010) \({ }^{1}\), and the building with its subsequent (1968-1989) additions has been in continuous use as an auto repair shop run by the DeGroot family (DeGroot 2018; Nashua Telegraph 1967).

The 1.15 -acre lot upon which the garage is located was part of a larger lot purchased by Jacob DeGroot's father, Garrit DeGroot (1889-1976) in 1946. \({ }^{2}\) That lot ran from Route 102 north to Tsienneto Road. According to family sources Jacob sent the money to buy at least a portion of the property to his father while he was still in the service in Germany (DeGroot 2018). Garrit transferred part of the land he had acquired in 1946 (the part on Tsienneto Road) to Jacob in 1947 after he returned from Germany and soon thereafter Jacob constructed the house at 91 Tsienneto Road. (It remains in the family today.)
Jacob DeGroot had been a wrecker driver during World War II and did similar work when he returned for a variety of automobile dealers in the Derry area (DeGroot 2018). In 1953, Jacob purchased the remaining eastern part of the lot his father had acquired in 1946 and in 1961 he received a permit to build on what was to become the site of the garage (Nashua Telegraph 1967). The first part of Jake's Auto Body was small - a roughly \(32^{\prime} \times 20^{\prime}\) building with a single vehicle bay. During the early years of the business, Jacob continued to work for automobile dealers during nights and weekends to supplement his income (DeGroot 2018). As the business grew, in 1968/9 DeGroot added on the long, three-vehicle-bay center section of the building, which roughly tripled its size. \({ }^{3}\) The concrete block foundations of this part of the building were salvaged from the garage on the Robert Frost Farm, which DeGroot demolished before the property was sold to the state in 1965 (DeGroot 2018). The end section of the garage toward Tsienneto Road was added in 1981, and an office addition was added onto the front (i.e., toward Chester Road/Route 102) in 1989 (DeGroot 2018).

Since 1987 the property has been owned by Jacob DeGroot's son, John G. DeGroot, who took over the business when his father retired. The use of the building, however, has remained unchanged over the years (DeGroot 2018). The business continues to do car repair/mechanical services, auto body repair and paint, and also sells used cars as it did in the 1960s (DeGroot 2018; Nashua Telegraph). Jake's Auto Body prospered in Derry's growth period after the completion of Interstate 93 in 1963, generally benefiting from the increase in population and vehicles/commuters in the town. However, for the most part, over time the garage remained a smaller local operation with nearby Derry clients. Because of its location in a residential neighborhood, it generally did not attract passing traffic.

\section*{42. Applicable NHDHR Historic Contexts (please list names from appendix C)}
88. Automobile highways and culture, 1900-present

\footnotetext{
\({ }^{1}\) According to his obituary, Jacob Degroot was involved with veteran's issues and helped found the Boys Club of Greater Derry. He was also a fire warden with the East Derry fire department.
\({ }^{2}\) Garrit DeGroot, as well as his wife Teuntje (1891-1975), were natives of the Netherlands. Garrit immigrated to the U.S. in 1915 and worked as an engineer and later fireman for the railroad in Massachusetts. The family moved to Derry in the late 1930s or early 1940s when they purchased property on Tsienneto. Garrit apparently farmed his land (DeGroot 2018).
\({ }^{3}\) The building permit for the addition dates to August 1968, so it is possible the construction continued into the next year.
}

\section*{43. Architectural Description and Comparative Evaluation}

Jake's Auto Body, is located in central Derry on the west side of Chester Road (NH Route 102) just west of Beaver Lake. The building is set back roughly \(100^{\prime}\) from the road to accommodate a stream that runs diagonally through the lot; at the southern lot line the stream crosses the road and empties into Beaver Lake. The small part of the lot on the east side of the stream along Chester Road is used for parking. Although there is a footbridge over the stream from Chester Road, vehicle access to the garage is from Tsienneto Road, over an access easement on the 91 Tsienneto Road lot to the west. The garage lot is partially wooded with much of the open space used for parked cars. The area on the south side of the garage is heavily vegetated with a mixture of trees and bushes and is largely inaccessible.

Jake's Auto Body is a single story rectangular wood frame building. Roughly 100' long by 30 ' wide, the building has a generally east/west orientation, with entrances on the north side of the building. Garage doors - all replacements of a recent vintage - are rolling metal overhead doors with three fixed rectangular windows in the center of the door. The building has vinyl siding which replaced T111 siding on the earlier portions of the building. Foundations are a combination of poured concrete and concrete block.

As mentioned above, the building has four sections (three additions date from between 1968/9 and 1989). Going from east to west, the easternmost (i.e., closest to Route 102) section of the building is a shed-roofed office that was a 1989 addition to the original section of the building. The office addition has two double-hung \(1 / 1\) vinyl windows on the east (road) elevation and one on the north elevation. A concrete block exterior chimney is located in this section. The main entrance to the building is in this section on the north elevation; it has a vinyl single door of recent vintage. The small gabled roof original (1961) section of the building (second section in from the east/Chester Road side) consists of a single garage bay. This section of the building has a north/south orientation with the gabled entrance to the north. A sign ("Jake’s Auto Body Sales \& Service Towing") is located on the gable. The next section, the long 1968/9 three-vehicle-bay extension, also has a gabled roof, however with an east/west orientation. Vehicle bays on this section are higher than that on the original section. The westernmost (1981) section of the building is roughly square and continues the roof orientation of the center section (although slightly lower). There are no vehicle bays on this section.

\section*{Comparative Property}

A comparable property to Jake's Auto Body in Derry is the Space Town Auto Body at 66 Scobie Pond Road which was built ca. 1958 (photo). This large (approximately 70' by \(80^{\prime}\) ) gable roofed garage has pre-fabricated wood walls, a metal roof and three early or original overhead bay doors. The building's one minor addition for handicapped access does not detract significantly from integrity. Overall the building displays a significantly higher level of integrity than Jake's Auto Body.

\section*{44. National or State Register Criteria Statement of Significance}

Criterion A: Jake's Auto Body did generally benefit from mid-twentieth century changes in Derry tied to suburban growth and improvements in transportation, such as nearby I-93. However it remained largely a local operation and it does not in particular exemplify these themes. There are other Derry garages/auto body businesses that better illustrate
the contexts. It is of some interest as a long-standing business in the community but does not rise to the level of significance required for the National Register under this Criterion.

Criterion B: Jake's Auto Body is not eligible under this Criterion as it is not associated with a person of historical significance.
Criterion C: Jake's Auto Body does not embody the distinctive characteristics of a type, period, or method of construction, nor is it the work of a master. In a general sense, with a series of automotive bays the building does conform to the service garage or automotive repair building type, but due to its later additions and alterations it does not clearly demonstrate the type and it does not retain sufficient integrity to communicate its original design. There are other Derry garages/auto body businesses that retain integrity and better illustrate the type. Therefore, this property is not eligible for the National Register under Criterion C.

\section*{45. Period of Significance}

1961-1989

\section*{46. Statement of Integrity}

The property retains integrity of location, setting, and association. However, the building was constructed in four stages over the period from 1961 to 1989 so the majority of the fabric of the building actually dates from after 1968/9, as does the massing. Thus significant elements of the building's integrity have been compromised. In particular, the replacement of original siding with vinyl siding and the newer vinyl replacement garage/bay doors compromise the building's integrity of materials.

\section*{47. Boundary Discussion}

The boundary of the area surveyed corresponds to Derry lot \(55 / 011 / 001\) shown on the Property Map on page 3 .

Area Form

\section*{Franklin Terrace Historic Area}
1. Type of Area Form

Town-wide: \(\quad \square\)
Historic District: \(\boxtimes\)
Project Area: \(\quad \square\)
2. Name of area: Franklin Terrace Historic Area
3. Location: Between Folsom Road, Franklin Street and Crystal Avenue
4. City or town: Derry
5. County: Rockingham
6. USGS quadrangle name(s): Manchester, NH
7. Dataset: SP Feet, NAD83
8. SP Feet: (shown on location map)

A: X: 1074370.309378; Y: 142440.614174
B: \(\underline{X}: 1075082.602857 ; Y: 143345.893529\)
\(\mathrm{C}: \underline{\mathrm{X}: 1075074.425043 ; \mathrm{Y}: 141504.987565}\)
9. Inventory numbers in this area:

DER0152-19 Folsom Road
10. Setting: Densely settled residential area of four blocks adjacent to modern commercial strip
11. Acreage: approximately 15 acres
12. Preparer(s): Kari Laprey, Reagan Ruedig
13. Organization: Preservation Company
14. Date(s) of field survey: June 2018
15. Location Map

\section*{16. Sketch Map}

See large-format Sketch Map included

\section*{17. Methods and Purpose}

This area form was prepared for the Exit 4A Project, 2018, for which properties built prior to ca. 1968 were inventoried. Franklin Terrace is a residential neighborhood built over nearly a century on a subdivision platted in 1908. Properties at the northern end of the area are potentially impacted by the proposed project (specifically 19 Folsom Road, 11 Folsom Road and 8 Laconia Avenue). A single house in the area, 19 Folsom Road, was previously documented for the New Hampshire Division of Historic Resources (NHDHR) as DER0152. The Franklin Terrace subdivision is a definable area, identified as a possible historic district. However, the neighborhood does not have integrity for a specific historic period, because it developed gradually, with nearly a third of the construction taking place in the past fifty years and most of the older homes substantially remodeled. The area contains a total of forty-five residential properties. Twenty-six of the properties that are more than fifty years old retain some integrity, i.e. the original form and type is evident. All but one or two of those have been remodeled with new siding, windows, doors, etc. Six other pre-1968 houses have large additions obscuring their original form and thirteen houses were built in the past fifty years.
All residential buildings within the Franklin Terrace subdivision plan were photographed with photo locations keyed to the sketch map. The district maps are based on Town of Derry GIS mapping. Estimated construction dates are based on Derry tax assessments, adjusted in some cases based on research. Properties are identified by street address, with tax parcel numbers cross referenced in the text and property table. Properties are arranged roughly geographically. Streets are presented from west to east, with addresses in order from south to north. All the residential buildings in the area platted in 1908 are included. Lots on the eastern edge of the subdivision, fronting on Crystal Avenue/NH 28, developed separately from the neighborhood with commercial buildings on larger parcels. The adjacent residential streets bordering Franklin Terrace on the west and south were subdivided independently, though they were built up during the same time frame. The mid-twentieth century houses on the northwest side of the Folsom Road were not part of the Franklin Terrace subdivision plan and those in the project area are surveyed individually. Only one property fronting on Franklin Street was part of the subdivision. Other homes on either side of Franklin Street date from the early 1900s through the 1980s.
Historic background research sources were historic maps, local histories, population, census and birth and death records. Limited deed research was carried out for a few properties to determine construction dates of the earliest homes and identify basic patterns of ownership and development. The deed references are given in the text to aid future researchers. Due to the limited potential for eligibility and for effects by the current project, the architectural descriptions of each resource are presented in a table of properties, with detailed discussion only of those few impacted resources.

\section*{18. Geographical Context}

Franklin Terrace is in western Derry, about a half-mile north of the village of West Derry and threequarters of a mile west of Derry Village. Interstate-93 is a mile to the west, just over the Londonderry line. The neighborhood is about 1.5 miles from Exit 4, the I-93/NH 102 interchange, and under three miles from Exit 5. Downtown Manchester is roughly a twelve-mile drive.
The grid of streets occupies relatively flat land on the eastern side of Shields Brook, which flows northsouth towards Beaver Brook. Shields Brook is dammed to create Hood's Pond, which has a small public park on the north edge of West Derry village. Derry's topography is uneven but gently rolling at an overall low elevation of only about 200-300 feet above sea level.

The Franklin Terrace subdivision fills a triangular area between converging main roads. Crystal Avenue/NH 28, which borders the neighborhood on the east, runs north-south on the direct route between Manchester and West Derry. Franklin Street runs north-northwest to south-southeast parallel to Shields Brook, about 0.1 to 0.2 of a mile west of Crystal Avenue. Folsom Road across the northwest edge of the historic area runs southwest from the junction of Crystal/NH 28, Rockingham Road/NH 28 and Tsienneto Road. Folsom Road connects to the upper end of High Street on the far side of Shields Brook and continues as Madden Road in Londonderry where it dead-ends at I-93. Four parallel residential streets, called Concord, Manchester Claremont and Laconia avenues, run southeast from Folsom Road toward Crystal Ave, roughly parallel to Franklin Street. A cross street, Exeter Street, connects Franklin Street, Concord Manchester and Claremont. A shorter cross street, Berlin Avenue, bounds the area on the southeast.

\section*{19. Historical Background}

The Franklin Terrace subdivision was laid out in 1908 with streets named for New Hampshire cities and towns. The sale of lots to investors began immediately, but construction took place very slowly from the 1920s through the 1960s and beyond. The development of the neighborhood relates to the growth of West Derry, formerly Derry Depot, in the early 1900s and the population boom of the 1950s60s period. During the same periods, adjacent lots along the older roads, Franklin Street and Folsom Road, were developed and Crystal Avenue/NH 28 became a commercial strip.
1720-1908 Farmland on Folsom Road, Crystal Avenue and Franklin Street
Until the early twentieth century this was a rural area with scattered farmhouses and large tracts of open land. The overall pattern of property lines and roads in the vicinity relates to the original land divisions. The roads developed as part of the local and regional transportation routes. Folsom Road/Madden Road dates from the 1720 's when Londonderry, including Derry was settled and it was the road to the first meetinghouse. The four-way intersection with Tsienneto Road, the early route to Chester, and Pinkerton Street and Manchester Road, which formed the main route through Londonderry to Manchester, was known as Folsom's Corner and then Ross' Corner for the owners of the farmhouse that stood in the western quadrant of the junction until the 1980s. A district schoolhouse was located on the southeast corner of the intersection (Chace 1857). The primary north-south road through town was the Londonderry Turnpike (now Bypass 28 and NH 28) established in the early 1800s through the small mill hamlet of Derry Village.
After the Manchester and Lawrence Railroad was built through the southwest corner of town in 1849, Derry Depot or West Derry grew up around the station to become the primary town center. A commercial downtown developed along East and West Broadway and large shoe factories were built near the railroad. Industry resulted in population growth and Derry became the third largest community in Rockingham County in the late nineteenth century. Between 1890 and 1900 the town saw an increase of nearly a thousand people to over 3,500. New residential streets were laid out. Crystal Avenue was built as a more direct route between West Derry and the road to Manchester (Norris 1887). It became the location of St. Thomas Aquinas Roman Catholic Church completed in 1888. A parallel north-south road, Franklin Street, connected Folsom Road and West Broadway in the 1890s (Hurd 1892; USGS 1903). At the end of the century, a few isolated homes were located in the area, with open land surrounding them (Bailey 1898). Around 1900, a series of short residential cross streets were platted between the lower ends of Franklin Street and Crystal Avenue. Lincoln,

Howard and Laurel streets were developed during a relatively short time with over a dozen \(11 / 2\)-story gable fronts and other small houses (USGS 1905; Sanborn 1921).
Derry experienced a population boom of over forty percent in the first decade of the 1900s. A prophetic statement in a 1902 article about the town declared, "The topography of Derry is such that it can and does grow in all directions, with practically its whole surface available for building purposes" (Cheney 1902:3 73). As street railways brought the first suburban development to the region, West Derry was connected to Manchester via the electric railway completed in 1907.

\section*{1908Edmund M. Warren Subdivision}

In 1908, a 21.2-acre tract of land between Crystal Avenue and a highway (Folsom Road) was acquired by George Barnes of Providence, RI, who mortgaged some of it to George Knowles (1850-1933) of Boxford, MA (Deed 630:447). It was sold in the spring of 1908 to real estate developer Edmund M. Warren of Providence, RI, who laid out a subdivision of 156 lots in April 1908 (Plan 521). This was one of two Derry subdivisions in which he was involved that year; plans for Hillside Park were drawn up in May. Edmund M. Warren (1869-1936) was a farmer's son from Island Falls, Aroostook County, Maine. He and his wife Mary A. White lived in East Providence, RI, until they divorced in 1911 and he moved to West Springfield, MA, according to censuses and directories. The Edmund M. Warren Realty Company, owners, developers and managers of real estate, did business in the New England states and New York.

The individual lots in the subdivision were roughly 0.1 acre. Most were combined in twos or threes for about 0.23 or 0.34 acre house lots. Deeds included restrictions including a ten-foot setback, no dwelling less than \(11 / 2\) stories or costing less than \(\$ 1,000\). Warren sold the first lots in 1908 , but deed research of selected properties suggests that the first construction did not take more than a dozen years after the lots were platted and, in many cases, they were not developed for decades. The value and return on these investments is unknown because these and subsequent deeds were recorded for \(\$ 1\) and "other valuable considerations." Examples of the first lot owners included Mrs. Stella Madden, a stitcher in the shoe factory who lived on Central and purchased four lots on Crystal Avenue in 1908, which she owned until 1946, then there were still no buildings on them (Deed 638:438; Deed 1060:294). Another shoe stitcher, Elisabeth Tanner, bought two lots on Concord that were not developed until 1998 (Deed 637:243). Thomas Cote, a machinist who lived on East Broadway, acquired lots on Concord Street where no house was built until after his estate sold the lots in 1957 (Deed 638:427).

\section*{1909-1944 New England Land Company (Otis Perry)}

In 1909, Warren transferred all his real estate holdings to New England Land Company, including land in Derry, Goffstown, Manchester and elsewhere (Deed 641:172). New England Land Company was based in Portland, ME. The main shareholder was real estate agent Otis Perry (1872-1944) who was from the same town as Warren in Aroostook County, ME. Perry lived on Commonwealth Avenue in Boston during the 1910s and later in Lexington, MA, according to directories and census. Otis Perry also became the assignee of the mortgage held by George Knowles (Deed 679:424).
Lots were sold off gradually in the 1910s and 20s. The first few houses were built at the southern end of the area closest to the downtown and existing residential streets. Development remained slow, as Derry's population growth came to an end. North of Exeter Street, there was no construction through the 1940s. However, increased mobility soon brought potential builders to outlying areas as automobiles superseded the railroad and streetcar. The street railway ceased to operate in 1926. NH Route 28 was established as a state road ca. 1915 following a series of older roads including Birch

Street, Crystal Avenue and Manchester Road through West Derry. Crystal Ave. north of the Catholic Church had several filling stations and shops, none of which are extant (Preservation Company 2002).
The 1931 Sanborn map shows five houses in this area. The recently remodeled one-story house at 2 Concord is said to date from 1920. 4 Berlin Ave. was a one-story house built after 1928 when lot 46 was purchased by Myer Miller (1880-1946) a cigar maker from New York City. A house on the site of 6 Concord Ave. was built in the 1920s on lots (6-7) purchased by Ida Chase from New England Land Company in 1920 (Deed 794:193). Her husband Asa Chase was a laborer and her son worked in the shoe factory (Census 1930). A one-story house also stood on the site of 5 Concord Street in the 1930s-50s (Sanborn 1950). 9 Concord (lots 38-39) was originally built ca. 1920. From 1935, a house on the site of 6 Concord was owned by widow Mary Joyce who worked in the shoe factory, as did her eldest children (Deed 906:246; Census 1940). Truck driver Earl Geer was the owner of a bungalow at 8 Concord (lots 8-9 and 10) built ca. 1939.
Many parcels were purchased but remained undeveloped. Lots on Claremont Ave. and Folsom Road were bought from New England Land Company by Agnes Dors in 1912 (Deed 668:336). She and her husband were Polish immigrants who lived in Manchester where he was a machinist in a shoe factory. It wasn't until 1947 that she sold the lots to her son who built a house at 19 Folsom Road (Deed 1080:231). John A. Wall (1855-1922) who worked in the shoe factory purchased lots in 1912, which he owned until 1921 while renting elsewhere in town (Deed 668:168). Louis P. Laronde who lived elsewhere on Franklin Street acquired multiple lots in the area in 1940 that he owned for nearly a decade (Deed 1144:291).
The whole area was listed as Franklin Terrace in the 1940 census and there were nine houses. Nearly all were owner-occupied, single-family homes. Several residents worked in shoe factories. Men were employed at the time in road construction, probably in WPA projects and as truck driver, sign painter and bookkeeper (Census 1940).

1944-1969 New England Land Company (Albert and Margaret Perry)
The New England Land Company holdings passed to Albert O. Perry (1900-1952) who lived in Exeter. During the 1940s, more lots were sold, mainly in pairs. All deeds were recorded for \(\$ 1\) and other valuable considerations. Margaret Perry (1903-2007), became president of New England Land Company in the 1950s and continued to sell off several groups of two or three lots each year as Derry's population grew again. By 1957, all lots had been sold. Margaret Perry, the sole surviving stockholder, president and director, dissolved the New England Land Company, which had no remaining liabilities or assets. Subsequent deeds of 1979 and 1986 confirmed transfer of any remaining right she might have (Deed 2346:566; Deed 2649:1141).

Robert Fortier (1897-1972) and his wife Catherine, who lived on Crystal Avenue where he had an automobile business, acquired multiple lots from New England Land Company and other interim owners in the 1940s-50s and sold them again in subsequent years. Automobile ownership allowed some residents to commute farther for work. A small ranch was built at 11 Folsom ca. 1947 for Oscar Warren who worked on a Londonderry poultry farm according to the census (Deed 1060:94). The altered house at 8 Laconia dates from ca. 1948, built for Alden and Dorothy Whitney on two lots bought in 1947 (Deed 1153:188). They owned it for nearly ten years. 19 Folsom Road (DER0152) was built ca. 1950 and was the home of George and Celia Dors for many years (Chase 1965). He worked for the telephone company as an installer according to city directories. Area residents continued to work in the shoe factories, such as Raymond Sweezy (1913-1972) who lived at 2 Concord Ave from 1957. The original part of 89 Franklin was built ca. 1951 for George and Anne Devine (Deed 1231:303). He was employed at the shoe factory and rented a house in West Derry previously (Census
1940). The historic shoe factories closed and burned, but in 1960, a new modern shoe factory was built on Manchester Road just north of this neighborhood.
Growth in the region was influenced by the construction of Interstate-93 between Massachusetts, Manchester, Concord and points north in the early 1960s. The interstate passes through the southwestern-most corner of Derry with an interchange at Route 102 just over the Londonderry line at edge of West Derry village. Between 1960 and 1970, Derry's population boomed by sixty-seven percent. Ten new homes were built in the neighborhood during that period.

\section*{1969-present Construction on Remaining Lots in Last Fifty Years,}

By the end of the 20th century, much of the land that had once been pasture and field, which had reforested during the first half of the 20th century, was the location of tracts of houses. According to the master plan, there were over 9,000 dwelling units in town in 1985. Some 3,251 units had been built between 1970 and 1980, many in multi-family buildings (Preservation Company 2002).
The last undeveloped farmland was east and north of this neighborhood where there is recent largescale commercial and industrial activity. Hood Plaza was built on the corner of Crystal Ave. and Pinkerton Street at the end of the 1960s. Multiple free-standing stores and restaurants were constructed on Crystal Avenue beginning in the 1980s, filling in vacant land and replacing older business. Only a couple of mid-twentieth century buildings remain extant.
New home construction in Derry took place primarily in new subdivisions, but infill of older neighborhoods continued until maximum density was reached. In Franklin Terrace over a dozen houses were built in the 1970s-90s period. A few houses were converted to two-family use. Most properties have changed hands multiple times in the last fifty years. Tax records indicate the area is now a mix of owner-occupied and rental properties.

\section*{20. Applicable NHDHR Historic Context(s)}
131. Suburban/bedroom community growth in New Hampshire, c.1850-present.

\section*{21. Architectural Description and Comparative Evaluation}

The Franklin Terrace subdivision is a grid of short parallel streets with forty-five residential properties on small lots. Homes date from the 1920s to the 1990s and are a mix of small capes, cottages and bungalow-type houses, many small, minimal ranch houses and more recent raised ranches and twostory houses. All have been updated in the past few decades with new siding and windows. Of the thirty-two homes in the area that are greater than fifty years old, five houses date from the 1910s-30s, three were built in the 1940s, fourteen in the 1950s and ten in the 1960s. Thirteen houses were built within the past fifty years.
The four parallel streets of varying lengths fill a roughly triangular area. Franklin Terrace was laid out in a total of 156 lots, which were typically about 0.1 acre. When sold, most lots were grouped in twos or threes, so when the area reached its fully-built state, the forty-five homes were about evenly spaced along the streets, with three to five properties in each block. Fronting on Crystal Avenue at the east edge of the subdivision, lots were irregularly shaped and when developed in the late twentieth century, were combined into triangular parcels creating a jagged edge along the border between the residential neighborhood and backs of the commercial properties.

\section*{Franklin Terrace Historic Area}

This is predominantly a single-family area, with small houses of two or three bedrooms. Three of the houses were built as duplex/two families and two or more of the older homes have been converted for two family use. Nearly all of the buildings are one or \(1 \frac{1}{2}\) stories except for some of the newest ones. Roofs are gable or hip. All buildings are wood frame construction, on concrete block and poured concrete foundations. Vinyl siding and \(1 / 1\) windows are nearly ubiquitous, and roofs are asphalt shingled. The homes have few stylistic architectural details. Three-part picture windows are the only common feature, but most have been replaced. The front entries are unadorned. Most have new doors and new small wooden decks or concrete steps. There are few outbuildings including new sheds and detached garages, only one of which appears to be original. The rectangular, flat lots include front lawns, back yards, short paved driveways and some mature trees. Foundation plantings are popular. Some houses have modern retaining walls of concrete or stone or new fencing.
The five oldest houses in the neighborhood date from the 1920s-30s, but all have been remodeled. Three have large additions that obscure the appearance of the original building. The Bungalow was a common local house type from the 1910s. 6 Exeter (Photos 26-27) is an example of a small Bungalow with hip roof and dormers, though it lacks the characteristic front porch. 8 Concord (Photo 7) has a clipped gable roof and front porch, so the original Bungalow form is evident despite additions on both sides. 9 Concord (Photo 8 ) began as a one-story house, enlarged into a two-family home with a twostory addition in the mid-twentieth century. The original form of the 1930s house at 2 Concord Ave. (Photo3) is not evident due to expansion and remodeling. The small house at 4 Berlin Ave. (Photo 2) was enlarged by the addition of a second story. Other early twentieth century, one-story houses stood on the sites of 6 Concord and 5 Concord (Sanborn 1950).
There was construction of only about three more homes during the 1940s according to the tax card dates. The post-WWII, a population boom began and about fourteen houses were built in this area in the 1950 s and ten in the 1960 s . All were small one and \(11 / 2\)-story houses with little architectural detailing or ornament.

Several \(1 \frac{1}{2}\)-story capes characterized by a center entry and a three or five-bay façade include 5 Folsom (Photos 20-21) and 12 Claremont (Photo 48), as well as 20 Manchester Ave. (Photo 35) which has brand new siding. A more altered version is at 8 Laconia, which has added dormers, oriel windows and new front entry (Photos 51-52). The least altered house in Franklin Terrace is a \(11 / 2\)-story cottage, with a gable front and side entry at 19 Folsom (Photos 53-54). It retains wooden clapboards and the original \(6 / 1\) windows. One house has a gambrel roof suggesting the Dutch Colonial style, but no other features (Photo 11).

About twenty of the houses in the area are classified as ranches due to their one-story rectangular form. The most common small ranch type in the area is the side-gabled form with low-pitched gable roof. Three or four-bay facades are asymmetrical with a three-part picture window but no other details or ornament. Examples of this type are 1, 2, 3 and 4 Exeter Street (Photos 12-15), 7, 9, 11 and 13 Folsom Road (Photos 22, 36-37, 38-39 and 41-42), 12, 13 and 18 Manchester Ave. (Photos 25, 28-29,33) and 4 Laconia Ave. (Photo 49). Two slightly larger ranches have hip roofs. 3 Claremont (Photo 42) has all new siding and windows, while 7 Claremont (Photo 46) retains "form stone" siding, which was popular in Derry during the \(1950 \mathrm{~s}-60 \mathrm{~s}\), a stone chimney and picture windows. 6 Claremont (Photo 45) and 10 Manchester (Photo 23) are ranches with low shed roofs and overhanging eaves. Other ranch houses have been altered by large additions, including 16 Manchester Ave. (Photo 31) and 89 Franklin Street (Photo 1). Garages were fairly common in the mid-twentieth century; six of the ranches have attached garages, three have car ports.

Late twentieth century houses are a mix of types, all on small parcels like the earlier homes. The raised ranch form with entry at ground level, living space above and finished basement below was popular in Derry and this area has four raised ranches built in the 1970s (12 and 15 Concord, 17 and 19 Manchester, Photos 10, 16, 32, 34). Other houses built in recent decades are a duplex with Mansard roof (Photo 6), two-story houses at 5 and 6 Concord Ave. (Photo 4, 7) and capes at 4 Claremont and 17 Concord (Photos 17 and 43).

\section*{Property Descriptions}

Three properties with potential effects under the Exit 4A Project are described below.
11 Folsom Road (35-40) ca. 1947 ranch with ell, Photos 38-39
A small ranch is located on the corner of Folsom Road and Claremont Ave. The house faces Folsom with ell and driveway on Claremont. The one-story house has low-pitched gable roofs. The windows are \(1 / 1\) replacements and the walls, trim and shutters are vinyl. The four-bay façade has new casement windows. A concrete block chimney is inset in the gable end wall. The ell may be an addition. It has board and batten siding. The windows and doors of the back entry and garage are modern. Added to the end of the ell is a smaller one-story section with overhanging roofs on both sides. The side and back yard is enclosed by palisade fence. There is an inground pool. The small front yard is flat lawn with a mature tree near the corner.
8 Laconia Avenue (35-27) ca. 1948 remodeled cape, Photos 51-52
This house is oriented toward Laconia Ave. with driveway and parking along Folsom Road and a small home business in the back ell. The \(11 / 2\)-story cape has a center entry and 3-bay façade. There are large shed dormers on the front roof slopes that appear to be a modern addition. The entry is sheltered by a gable hood. The entry trim and oriel windows on the façade are new. All other windows have \(1 / 1\) replacement sashes. The siding, trim and shutters are vinyl. The foundation is concrete. An asphalt walk leads to the front door, which has new concrete steps. A side entry is through a gabled portico. The one-story ell has sliding glass doors and a new deck. A modern shed stands beside the parking lot near Folsom Road. There is a sign for the home business on the corner and front lawn along Laconia Ave.
19 Folsom Road, DER0152, (32-20) ca. 1950 cottage, Photos 53-54
The Dors House, inventoried in 2000, is a small Colonial Revival cottage, built c. 1950 on the southeast side of Folsom Road. The \(11 / 2\)-story house is oriented laterally to the street, with a gable wall dormer and central entry pavilion on the facade. The wood frame structure is supported by a concrete block foundation. The walls are sheathed in clapboards and the roof in asphalt shingles. The eaves are close cropped with a molded raking cornice. Windows have flat trim and contain double-hung \(6 / 1\) sash. The entry, into the small enclosed pavilion, is framed by channeled boards with corner blocks. The front of the house is blocked from view by large cedars. Open lawn surrounds the house, shaded by tall pines in the rear. The 0.8 acre parcel is located on the comer of Folsom and Laconia Street. The driveway and a two car garage with novelty siding and overhead doors on its front gable, are located on Laconia Street. The property is located at the upper end of Folsom Road at the edge of the commercial area around the intersection of Crystal Avenue.

\section*{Franklin Terrace Historic Area}

\section*{List of Properties}

All properties in the area are listed with descriptions in the following table. Address, photo and tax numbers are cross-referenced. The integrity assessment is based on whether the house retains its original form and massing. Nearly all properties have been remodeled to some degree.
\begin{tabular}{|c|c|c|c|c|c|c|}

\section*{Comparative Evaluation}

Derry has extensive areas of residential subdivisions on all sides of the village of West Derry. There are grids of short side streets for several blocks north and south of Broadway with a mix of late nineteenth and early twentieth century homes. The outer edges of the village were divided in the early 1900s. Residential streets immediately south of Franklin Terrace between Franklin Street and Crystal Avenue, Lincoln, Howard and Laurel streets, date from around 1900 and have a more consistent collection of small early 1900s homes, including \(11 / 2\)-story side halls and bungalows and houses with clipped gable and gambrel roofs. The Highlands, laid out in 1902 off Hillside Ave. on the western edge of West Derry, developed over a long period like Franklin Terrace. Another 1908 subdivision by the same developer as Franklin Terrace, Hillside Park, is located on both sides of Hillside Avenue near the Londonderry line. It too has a mix of old and new homes and lacks integrity for the early twentieth century period.

\section*{22. Statement of Significance}

In 2000, a single house in Franklin Terrace, DER0152 at 19 Folsom Road, was determined not to be individually eligible for the National Register of Historic Places. There has been no other historic resources survey in the area.
The Franklin Terrace Historic Area does not meet the criteria for listing in the National Register or NH State Register as a historic district, because it is not a significant and distinguishable entity. The subdivision plan is the unifying element that defines the area. The neighborhood does not retain integrity for a specific historic trend or period due to the ongoing development. The houses were built over time, with substantial new construction within the last fifty years. The neighborhood is not significant as a collection of small homes for representing the evolution of building types or construction techniques, due to the universal remodeling of all but the newest buildings with modern siding, windows and doors. Forty-five percent of the forty-five houses in the Franklin Terrace subdivision are less than fifty years old or lack integrity due to additions altering their form and massing. While twenty-five houses retain some degree of integrity, the cumulative changes have resulted in a loss of nearly all character-defining features.

\section*{23. Periods(s) of Significance}

N/A

\section*{24. Statement of Integrity}

The 1908 subdivision retains integrity of location and the design of the parallel streets and grid of small house lots. However, the area does not have the spatial organization it acquired during the historic period due to subsequent construction. The area did not achieve its current density until the 1980s-90s. The buildings do not represent a specific period and the feeling is that of a mixed age neighborhood. Nearly a third of the houses are less than fifty years old.

Most houses retain their basic original form and overall design, but half a dozen houses, including several of the oldest ones, have large-scale additions that alter the overall massing. A very small percentage retain any visible historic materials or features. The materials and workmanship of nearly all of the houses over fifty years old have been lost to vinyl siding and trim and replacement of windows and doors. Even the buildings of the 1970s have replacement siding and windows. Front entries have been reconfigured and picture windows replaced. The cumulative changes result in an overall lack of integrity of design.

The setting within the neighborhood changed gradually as more homes were built and the relationship between the older buildings was changed by recent infill. Several of the earlier homes were replaced. The surrounding setting was altered in the late twentieth century by the large-scale commercial development of Crystal Avenue on one edge of the area. The streets themselves are the only historic landscape characteristics. All built features such as walls and fencing are modern. There are some mature trees, but most of the foundation plantings, gardens and outbuildings are not old.

\section*{25. Boundary Justification}

\section*{26. Boundary Description}

The surveyed area is defined by the residential neighborhood within the subdivision known as Franklin Terrace. The area is shown on the 1908 plat plan. The northwest bound of the subdivision is Folsom Road. On the southwest, the boundary is the back of properties on the east side of Franklin Street, except for 89 Franklin located on lots platted in the 1908 subdivision. The neighborhood includes residential streets, Concord, Manchester, Claremont and Laconia avenues Commercial properties at the end of those streets and fronting on Crystal Avenue/NH 28 are not included. Although part of the subdivision plan, they developed as part of a growing commercial strip on Route 28, with larger groups of lots and larger commercial buildings, most from the late twentieth century. See boundary on both Location Map and Sketch Map.
